Electrical News

Generation, Transmission and Application of Electricity

Smith Hydraulic Turbines

Have justified their installation in many first class hydro-electric developments where Efficiency, Reliability and Durability are deciding factors

If interested in Water Power, write Dept. "N" for Bulletin

Above illustration shows a pair of Type "N" Turbines, recently installed for International Paper Company, Glens Falls, N.Y., Mill, under 42 ft. head, developing 2000 H.P.

Note the details and general appearance of refinement.

Tests of this type Turbine at Holyoke showed 92 per cent. efficiency. Extraordinary results obtained by horizontal shaft tests of similar Turbines resulted in our furnishing 44 pairs of Type "N" Turbines to Michigan Northern Power Company, Sault Ste. Marie, Mich.

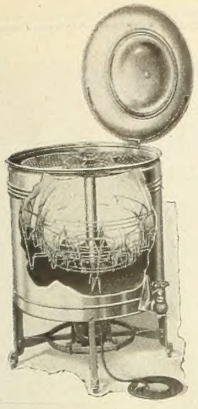
The Best Known Cable Reel in Canada

In Halifax or Vancouver, whether on the public thoroughfares of our larger cities or smaller towns, wherever there is a cable installation in progress, the reels invariably bear the name of the Northern Electric Company, Limited.

The installation may be overhead, underground or submarine. It may be for a Telephone Company, a Telegraph Company, a Railroad Company, or for a street lighting system.



The quality, both of the product and the service, is largely the reason for the universal demand for Wires and Cables of Northern Electric manufacture.

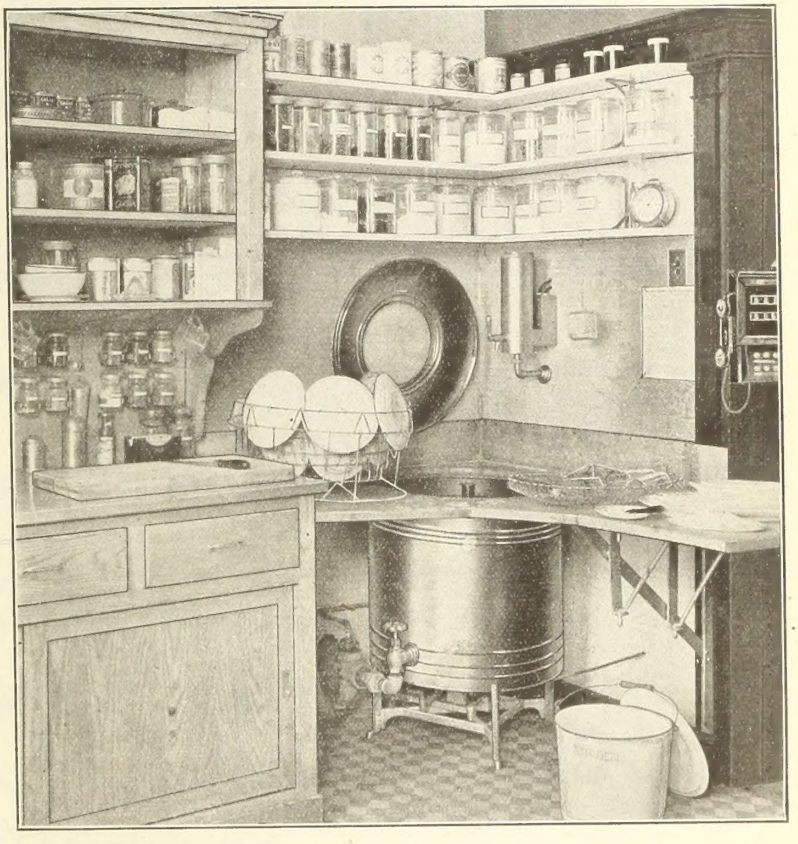
X-Ray View of Dishwasher



Northern Electric Dishwashers

Solve the Servant Problem

for the woman who does her own housework.

This machine does all the washing rinsing and drying and does it quickly and thoroughly without breaking the dishes or glasses. And what is most important, it does away with the unsanitary dish towel.

Of all the household devices on the market, the electric dishwasher is the most useful. It solves the modern problem of shortage of labor. The NORTHERN ELECTRIC Dishwasher is built in two sizes. The smaller size is suitable for the needs of the average sized family. The larger handles the dishwashing for Hotels, Restaurants, Clubs and large sized families.

Photograph showing Family Type permanently installed

Household Type

There should be a good demand for these dishwashers in your territory, especially during the Christmas season. What more suitable Christmas suggestion could you make to your trade? Besides, we can promise you a very good margin of profit on every dishwasher sold. Write our nearest house for our attractive proposition.

National Brackets

CARRY the wires not over, nor around, nor under, but *through* the porcelain insulators. That this is quicker is obvious; that it is cheaper is apparent when tie-wire and labor costs are compared; that it is more secure is evident when it is remembered that the holes through which the wires pass are "iron bound," the construction being similar to that of strain insulators. Write for complete Descriptive Bulletin No. 601, showing one, two and three point styles and applications.

A Very Happy New Year

Showing cars at Youngstown, Ohio, lighted with Keystone Specialties.

Your Cars After Sun-down

During the short day period when the evening rush hours are hours of darkness,
When the theatre traffic is heaviest,
When snow, ice and cold make more dangerous physical conditions prevail—
Then of all times, you should be using "Safety" Car Lighting Fixtures, Illuminated Car Signs and "Golden Glow" Headlights.
Thousands of cars in the States and throughout the Dominion are thus equipped.
Safety, efficiency, economy, attractiveness and comfort are the result. The illustration shows how efficiently—

These Keystone Specialties will light-up your cars

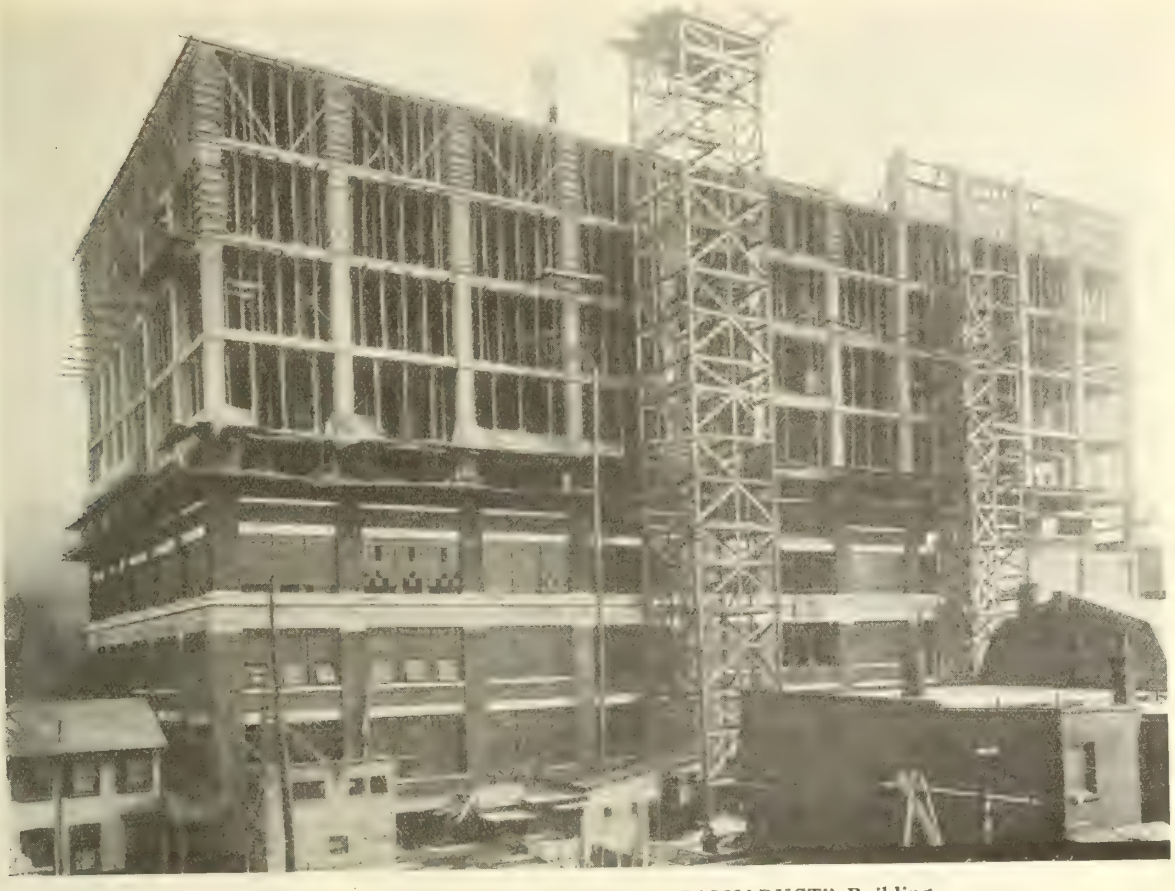
THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.



The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

LET US QUOTE ON YOUR REQUIREMENTS

Proof of the Efficiency and Economy of Oxy-Acetylene Welding

Welded Transformer Case.

Courtesy: Packard Electric Co., St. Catharines, Ont.

Whenever you see a **Welded Joint** you know that it has stood the test in point of efficiency and economy. Follow the example of other leading manufacturers and others in your industry and adopt it, because it can be just as beneficial to you. There is no limit to its uses—no doubt as to its money-saving possibilities.

It Saves Many Times Its Cost:—

For RECLAIMING broken machine parts,
USING material, otherwise wasted,
JOINING metal that cannot be otherwise done,
ADDING metal to parts deficient,
MAKING a leak and trouble-proof joint,
AND many other purposes too numerous to mention.

Will you allow us to tell you how an "A.L.S." Oxy-Acetylene Welding Outfit will SAVE YOU MONEY?

Investigation costs nothing. We are pioneers of the process and best able to give you Service; your interest will be appreciated. Write to-day.

This New Oil Circuit Breaker

Type F P-10 Oil Circuit Breaker

gives SAFETY at low cost

This is the lowest priced oil circuit breaker offered by the Canadian General Electric Co., Limited. It is used for controlling small induction motors that can be thrown directly on the line. For the service recommended it is unsurpassed. All live parts, and all moving parts except the operating handle, are totally enclosed, and the breaker meets all the requirements of the "Safety First" movement.

The breaker is furnished in four types: Non-automatic, with double coil overload trip, with low voltage release, or with a combination of low voltage release and overload protective plugs.

The operating handle can be locked open, insuring against accidental or unauthorized operation.

This oil circuit breaker is recommended for 550-volt motors up to ten horsepower or for currents up to thirty amperes at less than 550 volts.

It is simple, compact, small and durable.

Robbins & Myers Fans

THE beautiful finish and graceful design of The Robbins & Myers Fan are a big sales help for the dealer. They attract the customer's attention immediately and carry a strong suggestion of the quality built into the Fan.

The graceful outlines, the smooth, even surface of the drawn steel frame and base, the highly polished brass blades, the neatly constructed guard, the felt base, the smooth, gloss-black, baked enamel finish and the neat gilt stripes are all features of the R & M Fan which make a strong appeal to the buyer and result in easy sales for the dealer. Quality is reflected in the appearance of every detail.

And in every respect—performance, durability and efficiency—the R & M Fan measures up to its appearance. When you sell a Robbins & Myers Fan you know your customer will be just as highly pleased with the service it will give as he is with the appearance. He is insured many years, probably a lifetime of reliable fan service.

Appearance, performance and reputation all contribute to easy, profitable sales when you sell Robbins & Myers Fans.

Vol. 27 Toronto, January 1, 1918 No. 1

U. S. Values Engineering Students

Under an order dated December 8, the selective service regulations issued by the Secretary of War of the United States, exempts certain engineering students from the draft, on the ground that their services are more valuable in the exercise of the profession for which they have specially fitted themselves than they would be as privates in the ranks.

All engineering students are not to be exempted but merely those who have shown special adaptability for the work, and the basis on which the selection will be made is as follows: The faculty of each engineering school will go back through its records of the past ten years and endeavor to establish, on the basis of scholastic markings and subsequent professional performance, a grading above which would be classed one-third of the graduates of the school. Having arranged that grading in any way satisfactory to themselves they will then consider the draft-age students in the school and recommend for exemption those who are apparently above this established grade. It will be seen that this mode of classification may include very many more than one-third, or, it may be, very many less than one-third of the students actually in attendance in any collage.

The point to which we wish to draw special attention is that in the United States they have considered the engineering profession of sufficient importance to grant the students special exemption so that they may complete their courses. The sentiment of the War Department appears to have been voiced in a recent address by ex-President Taft before the annual meeting of the American Society of Mechanical Engineers. Mr. Taft said: "You engineers constitute one of the two professions that are indispensable to the country in the carrying on of the struggle in which the people of the United States are now about to devote themselves—yours and the medical profession. Congress and the Administration should see to it that the medical students and the engineering students should be reserved for the work for which they are particularly fitted; that the engineering students and the medical students should be required to go on and complete their preparation as engineers and physicians so that they may become engineers and doctors and may then be gathered into the service."

What is Canada doing in this respect? Special instructions have been given to exempt medical, dental and veterinary students. No exemption is being granted engineering students. Are engineers less valuable in this war than dentists? Are they occupying a place secondary in importance to veterinary students? If so, why is it called an engineers' war? We have repeatedly voiced the opinion that engineers are almost equally essential with medical men in this war. Is it not time our engineering societies should make themselves heard in an endeavor to influence our government to act along lines which the administrators in the United States not only consider reasonable but absolutely essential?

Overcoming the Peak Problem

There are few places in Ontario where the shortage of electric power is not seriously inconveniencing the public during the present peak-load season. Various means have been adopted in an endeavor to overcome the difficulty, but one of the most satisfactory is that which has been tried out in Brantford, where Mr. W. R. Catton is superintendent of the Hydro-electric System. The scheme generally adopted has been to hold off the street lights until the peak is passed, or to endeavor to get the general public to co-operate and stay off the line during the peak so as to allow the essential factories to operate to full capacity. In Brantford, however, these conditions have been reversed and the manufacturers have kept off the peak and allowed the general public to have free use of their street, office and home service at a time when it is most appreciated. That is, the factories are closed down during the peak instead of, as is the usual custom, running on till about six o'clock. In other words, the factories set their day forward about an hour or an hour and a half instead of asking the general public to

do this. Possibly conditions in Brantford are such that this solution of the difficulty is more easily applicable there than in larger cities, but we are advised that it has worked admirably in that city and we have no doubt it could be applied with splendid results in many other places in this province where there is a present shortage of power.

Hamilton Cataract Power, Light and Traction Company's Section of the C.E.A.

The first regular meeting of the 1917-1918 season was held in the assembly room of the section, Terminal Station, on Thursday evening, November 29th, at 8.15 p.m. Mr. C. H. Fry, chairman of the section, presided. The meeting was unusually well attended, and the program very interesting and instructive. The evening started with a very pleasant function in the shape of a presentation of a wrist watch to Mr. Wm. Dorland by the members of the sub-station staff. For many years Mr. Dorland has been assistant superintendent of sub-stations under Mr. W. A. Sweet, the occasion for the presentation being his transfer and promotion to the position of superintendent of the company's power house at Decew Falls.

The guest of the evening was Mr. M. C. Gilman, sales manager of the Toronto Electric Light Company, and the newly elected secretary-treasurer of the Canadian Electrical Association. The feature of the program, however, was a paper presented by Mr. E. S. Jeffries, electrical engineer for the Steel Company of Canada, entitled "Electricity in the Steel Industry," and profusely illustrated with lantern slides. The various uses to which the electric current is put in the modern production of iron and steel was a surprise to everyone. It demonstrates that the present tremendous rate of production of steel is only possible by the use of the "silent servant."

The Jovian Order in Winnipeg

At the bi-weekly luncheon held by the Winnipeg Jovians on November 1, Major B. A. Cousin gave an interesting talk on his experiences at the front, in connection with the infantry operations in several of the memorable battles, and also on his work as artillery observer.

The former secretary-treasurer of the Winnipeg Jovian League, W. E. Skinner, of Minneapolis, Minn., also gave an interesting talk on the great work being done in his city and other points south of the line in connection with war preparations, and described in detail the manner in which the second Liberty Loan was followed up by the citizens' committees, resulting in such an unqualified success.

About forty members and guests listened with great interest to these talks. A representative body of Winnipeg Jovians also attended the bi-weekly luncheon at the St. Charles Hotel, Thursday, November 15, to hear Comptroller-General J. Gordon Steele speak on "The Functions of the Auditor in Public Affairs." The speaker dealt fully with the different phases of a modern auditor's services and gave a comprehensive talk on the functions of his profession. Mr. B. F. Griggs, auditor for the Greater Winnipeg Water District, gave a brief outline of the auditor's work in connection with that project, and dwelt particularly on the essential qualifications of a successful auditor.

The Winnipeg Jovian League have forwarded Christmas parcels to every member fighting for the glorious cause of democracy over at the battle front, and endeavor to keep in as close touch with them as possible. The Jovian Order, as well as the Winnipeg Jovian League, are carrying these members in good standing while on active service.

Winnipeg Jovians are just drawing up a schedule for another bowling tournament to be held very shortly, as this social sport has always proved very popular among the members.

The Place of the 50-Watt Mazda B Lamp

The following item appears in the last issue of the N. E. L. A. Bulletin regarding the 50-watt Mazda B lamp. It was prepared and submitted by the Lamp Committee of the N. E. L. A.:

The 50-Watt Mazda B Lamp

In the report of the Lamp Committee submitted this year the opinion was expressed that a determined effort should be made by central station companies generally to secure the introduction of the 50-watt lamp, and it was shown that the prediction made by the committee last year that this unit would meet with rather general adoption has been borne out by experience.

The tungsten filament lamp originated in Europe. In the early period of development, American manufacturers were inclined to follow European practice. Early progress was in the direction of finer filaments and smaller lamps. Beginning with the 100-watt lamp, the 60-watt lamp was developed, then the 40-watt, then the 25-watt, etc. These sizes were adopted because they corresponded approximately with the sizes of lamps which had been developed in Europe.

Later, American manufacturers assumed the lead in development of the tungsten filament lamp. It then became apparent that in following European practice in the development of smaller sizes too many sizes of lamps had been provided. The steps between some of the sizes were needlessly small. This occasioned unnecessary expense in the manufacture, handling, and stocking of lamps. A study of American conditions, with a view to remedying this difficulty, led to the conclusion that the best selection of sizes for the ordinary lamps would be as follows: 25 watts, 50 watts, 75 watts, and 100 watts.

The gradual substitution of lamps of these sizes for lamps of the sizes adopted under the stimulus of early European leadership has been undertaken. The 50-watt Mazda B lamp was made available early in 1916 and the 75-watt Mazda C lamp followed in July, 1916. The progress which has been made thus far tends to confirm the conclusion reached in advance, that the recently approved steps of 25, 50, 75, and 100 watts are well suited to American conditions.

Distribution of Different Sizes

The recent report of the Lamp Committee shows that during the calendar year 1916, 6.90 per cent. of all the Mazda B lamps of central station types produced during the year and sold to all kinds of users were of the 50-watt size. The distribution of demand among the sizes used for general lighting purposes was as shown in the middle column of the following table. The demand for 50-watt lamps has been greatest among central station companies. For example, the Lamp Committee is advised that the demand for 50-watt lamps by the members of the Association of Edison Illuminating Companies during the year ending April, 1917, formed 27.42 per cent. of the total demand for Mazda B lamps of the general lighting classes. The last column of the following table shows the demand of that association:

Watts.	N.E.L.A. demand.	A.E.I.C. demand.
15	6.98 p.c.	4.60 p.c
20	2.25	0.72
25	29.70	17.42
40	33.42	23.42
50	6.90	27.42
60	20.75	26.42
	100.00	100.00

The 50 watt lamp preserves the standard [illegible] to which central station customers have become accustomed through years of development. It is of substantially the same physical dimensions as the 50-watt carbon and the 50-watt Gem lamps. Its price is the same as that of the 40-watt lamp. Its life performance is known to be entirely acceptable. It deserves all encouragement at the hands of member companies.

It has become evident that standards of illumination intensity in various classes of lighting service vary with time. The standards in many classes of approved modern lighting practice are about as much in excess of those of ten years ago as the light production of the Mazda lamp per watt is in excess of the light production of the carbon lamp per watt. They are still low as compared with the standards of daylighting, even in interiors. As more efficient lamps become available, and as the public avails itself more extensively of the benefits of electric lighting, it is probable that the levels of illumination intensity will be raised considerably beyond the present standard. The 50-watt lamp as a substitute for the carbon and Gem lamps of ten years ago is, therefore, of an illuminating power which is by no means excessive. Indeed, in some cities the 60-watt lamp has found acceptance as a substitute for the old 50-watt carbon lamp in similar lighting practice.

Necessity for Diffusion

The advancing standards of lamp efficiency are accompanied by increasing brightness of light source. For satisfactory lighting results, the Mazda B lamp, and even more so the Mazda C lamp, should be concealed from view. For all purposes the light produced by these lamps should be diffused to some extent, the extent varying with the purpose to which the light is put. For some purposes it is desirable to alter the hue of the light somewhat in order to meet local decorative demands. The accomplishment of these ends involves an absorption of perhaps 50 per cent. of the light which is produced. As illuminating engineering principles are disseminated, the demands for diffusion and coloring of the light will become more general. Under these conditions the 50-watt Mazda lamp, considered in connection with the advance in the standard of illumination intensities which has been described above, will be too small a unit satisfactorily to replace the old 50-watt carbon lamp under the conditions which surrounded its use ten years ago, including the lower level of illumination intensity, the lesser need for diffusion of light, and the general lack of knowledge concerning illuminating engineering principles, and the advantages to be obtained from its adoption.

In these circumstances, the 50-watt lamp ought to find general acceptance at the hands of central station companies, and it ought everywhere quickly to outstrip in demand the 40-watt lamp, as it has already done in the practice of some member companies.

"Lightless" Days

A new regulation in New York provides that electric signs and all other unnecessary lighting be darkened on Sundays and Thursdays. These are, in effect, "lightless" days and the principal hotels and theatres are not only reducing their exterior lighting, but also from one-third to one-half the lights in public rooms and corridors. By this means it is hoped to realize a considerable saving in fuel.

Of two hundred and forty-seven persons who met violent deaths in Toronto during the year 1917, only four were electrocuted.

Electrical Training for Soldiers

By Douglas C. McMurtrie*

Electrical work in its various branches is proving a popular way in which to train soldiers crippled in the present war. It is one of the leading subjects of instruction at Queen Mary's Hospital, Roehampton, England, where there are at any one time hundreds of men with amputated limbs awaiting the fitting of artificial arms and legs and being meanwhile prepared for return to civil life—independent and self-supporting.

At the Pavilion Military Hospital, Brighton, there are likewise electrical classes, carried on in Queen Mary's Workshop, operated in conjunction with this centre for the care of limbless soldiers. There is provided instruction preparatory to various openings which call for a knowledge of electrical machines, lighting, telephones, and bell systems. The men are trained as electrical assistants and for attendants in private houses, theatres, hotels, business houses, workshops, mills, coal mines, and so forth. There is also a special course to enable men to qualify as switchboard attendants at electric power stations.

The Institution of Electrical Engineers, in co-operation with the London public educational authorities, has organized classes for training disabled soldiers and sailors as electrical substation attendants. The instruction is given at the Northampton Polytechnic Institute. Up to the present time 150 men have completed the course. The instruction comprises workshop practice in wiring and the use of simple tools, power-house demonstrations, electrical and physical laboratory work, class demonstrations in the elements of electrical engineering and of simple engineering physics, the writing of reports on demonstrations and laboratory work, and, in conclusion, an oral examination.

At the Regent Street Polytechnic, in London, there are courses of a similar nature. Here are received for more advanced training men who have done preliminary work in the hospital at Roehampton. The men are first instructed in general electrical work and then passed on to the London United Tramways for experience in generating plant and substation practice. This course takes from two to three months.

Second Most Popular Course

At the Battersea Polytechnic, in London, the principal says that the second most popular course offered to crippled soldiers is that in electrical testing or switch-board work. "We have trained successfully men suffering from shell shock and nervous trouble, together with other types of disablement. A fair education is required for this work, together with ability to do simple calculations. For this work we do not mind taking men who have only partial use of an arm or hand, as it often happens that the fuller use of the arm is simply a matter of time. We do not, however, care to take those who have actually lost an arm, and we would rather not have them if they have lost a leg, although the latter is not so important as the former. We have been able to place all the men who have been through this work, and the firms are willing to take other men when they become ready for work. We think this work offers reasonable wages and conditions."

The Fife Mining School, Cowdenbeath, England, conducts a course for electric motor and switchboard operatives. Some of the men are preparing to be underground motor attendants in the mines; in these cases their electrical

training is supplemented by preparation for a mine fireman's certificate.

A communication from the director of the school gives the following syllabus of the course:

What happens when an electric current passes in a conductor. Heating, glowing, and fusing of a wire carrying a current. Use of fuses. Tests with fuse wires. Replacement of fuses.

Resistances and their use in controlling currents. Measurements of electrical currents and pressures. Elementary notions of the construction of ammeters and voltmeters. Range of the instruments. Precautions to be observed in their use. Conductors and insulators. Insulated conductors of various types. Arrangement of conductors in series and in parallel circuits. Uses of porcelain, rubber, paper, slate, marble, etc., as insulators. Jointing. Construction and use of blow lamp and soldering iron. Making of married and T joints on conductors. Sweating of joints, thimbles, and connectors. Switches of various types and their use in the control of electricity.

Motor starters and their care and proper usage.

Trip devices. General arrangements of a switchboard.

Testing. Use of test lamp and detector for sorting out circuits. Pole finding.

Electric bells and indicators.

General idea of a direct-current generator.

General idea of direct-current motors.

General idea of the construction and use of a battery of accumulators, and of how it should be cared for.

Practical exercises in operating direct-current generators and motors and in charging a battery. Some simple notions of alternating-current generators and motors and on the synchronizing of two alternating-current generators.

The conception of national responsibility to the disabled soldier, not only to pay him a pension but to re-educate him in some trade which he can follow in spite of his handicap, was recognized for the first time early in the European war. It is now realized that the cripple, while perhaps unable to take up again his former trade, is not debarred from all occupation. The effort is always to select some trade related to the former occupation of the disabled man; in this way his former experience is not lost. A competent journeyman bricklayer who has lost an arm may be prepared by a suitable course in architectural drafting and the interpretation of plans to take a position as construction foreman of a bricklaying gang. It would be idle to give such a man a course in telegraphy. But a train hand who has been all his life familiar with railroad work may most wisely be trained as a telegraphic operator, with a little commercial instruction on the side.

The first country to make adequate provision for the trade-training of war cripples was France, where a school was started at Lyons a few months after the opening of hostilities. Now there are hundreds of instruction centres in the various belligerent countries. Even Belgium has several schools to meet the needs of her disabled soldiers.

In Canada the work is national, being carried on by the Federal Government, which has established throughout the Dominion schools for war cripples.

American interest in the subject is growing daily. In New York there has been established the Red Cross Institute for Crippled Soldiers and Sailors, made possible by a gift of more than $50,000 from Jeremiah Milbank. Committees have been formed and plans for reconstruction centres are under way in Chicago, Boston, and other cities. The surgeon-general's office of the War Department has announced its intention to establish training centres in connection with the great base hospitals.

Electric Welding Methods and Apparatus

Electrical welding apparatus is now used for cutting, joining, and building up metals in the manufacture of new machinery or other articles and in the repair and alteration of old ones. Electric welding has found a practical application in nearly all metal working industries, from the manufacture of small sheet metal boxes, small and complicated metal parts, such as those used in watches, to the building of great steel steamships and the structural work of modern skyscraper buildings and bridges. Iron, steel, copper, brass, and various other metals and alloys may be welded with varying degrees of success dependent upon the properties of the metals.

In this article, reproduced from Electrical Record, the practical features and characteristics of welding apparatus are dealt with rather than the processes of welding, so that no attempt will be made to enter into a discussion of the theory of the welding of metals.

Two Classes of Welding

Welding work may be divided into two general classes—forge or pressure welding and autogeneous welding. The first class is the one in which the pieces of metal to be united are heated until they are slightly softened and then pressure is applied by means of a hammer or lever, forcing them together and causing their particles to unite into what is known as the weld. A familiar example of forge or pressure welding is the work done in the blacksmith's shop by means of the forge fire, the anvil, and the hammer. The term autogeneous welding is applied to welds which are made by heating metals to such temperature that they will fuse together on contact without pressure being applied. The difference between autogeneous welds and those formerly described is mainly the difference in temperature of the metal. In the autogeneous weld the metal is heated to a state of fluidity and the two pieces flow together. The use of the autogeneous process, however, is not confined to the uniting of two pieces of metal. It is used to even a greater extent for adding metal to other metal pieces or parts, thus building them up or filling defects.

Classification of Welding Processes

A—Pressure Welding: 1. Forge, anvil and hammer. 2. Electric—(Alternating current)—Spot, butt, etc.

B—Autogeneous Welding: 1. Thermit welding. 2. Oxy-acetylene welding. 3. Electric arc welding (direct current). (a) Bernardos process. Carbon or graphite electrode, filling material introduced separately. (b) Slavianoff process. Metallic electrode, which is itself consumed for filling material. (c) Zerener process. Two carbon electrodes held in "V" form with points within field of electro-magnet.

Forge or pressure welding includes one of the two general processes of welding by means of electricity, and this process may be classified as electric pressure welding, under which heading butt, spot, cross, tee, and other forms are grouped.

Autogeneous welding may be divided according to three main processes, these being the thermit, oxy-acetylene, and the electric arc. These divisions and subdivisions may be

readily understood by reference to the accompanying tabulation of welding processes.

Electric Welding Processes

Welding by means of electricity as shown in the above classification may be divided into two general groups—pressure welding and autogeneous welding. In the former classification the metals to be joined are heated by the electric current being passed through the metals, the resistance causing the development of intense heat, which softens the metals, so that, upon the application of pressure, the two parts are united into a single piece. In this classification fall spot welding, butt welding, cross welding, tee welding, and similar processes.

Spot Welding

In spot and butt welding, alternating current is used because of the possibility of transformation from a relatively high to a relatively low voltage without loss of energy. Spot and butt welding machines consist essentially of an alternating current transformer and suitable electrodes. The transformer takes current at the ordinary commercial voltage and steps it down to the voltage used for this class of welding, which is about 3 to 5 volts. The two electrodes consist of copper rods of generous diameter, usually water-cooled, or, in the case of butt-welders, electrodes made in the shape of jaws, to which the work may be clamped. Means are provided in both spot and butt-welders for exerting pressure between the electrodes, which are generally connected by lever linkage to foot pedals or hand levers. The service lines are connected to the primary side of the transformer and the electrodes are connected to the secondary side.

In operation the work is placed between the electrodes and the current is turned on. At the welding voltage the current value, which may be varied to suit the work, is greatly increased and the resistance set up by the work which is interposed in the circuit causes the generation of intense heat. Within a certain time, varying from a fraction of a second to a half minute, or slightly longer, depending upon the size and physical properties of the metal worked on, the metal becomes softened at the point of application of the heat, so that upon the exertion of pressure by means of the foot pedal or hand lever controlled by the operator, the two parts to be welded are pressed together, causing the particles of metal to unite into a single homogeneous mass. Pressure is then released, the work removed and set aside to cool, as a completed joint.

Spot welding takes its name from the fact that the electrodes are pointed, and the welding takes place at certain spots or points wherever the work is applied. Spot welding is largely used for sheet metal work, and has been found to be largely applicable to work which formerly required the punch and rivet method. Spot welding is not only more rapid but cheaper than riveting, and the work turned out is usually more satisfactory, since the two pieces of joined metal virtually become one.

The operation of welding takes place in a vertical direction, the arms or horns of the spot-welder operating in an up-and-down direction, while the work is presented from a horizontal position.

Butt Welding

Butt welding machines operate upon a theory similar to that followed in spot welding, the difference being, as the name implies, that the butts or ends of the metal are joined rather than the sections of sheet metal worked on in spot welding. Butt welding machines operate in a horizontal direction. Heat is applied by the resistance set up by the work to a current of high amperage and low voltage obtained through a transformer similar to that used in the spot welding machine. The electrodes are equipped with clamps in which the rods or other pieces of metal to be worked may be fastened. The current passes through the jaws and clamps with little resistance, but, upon encountering the metal, great resistance is set up, which generates heat sufficient to soften the metal. Then pressure is exerted by the operator upon a lever so as to force together the two jaws having attached the heated bars, in such a way as to produce the proper joint.

Cross Welding, Etc.

Cross, ell, tee, and various other names are applied to welding by means of spot or butt welders, and merely signify the shape of the pieces of metal joined.

Arc Welding

Electric arc welding is an autogeneous process, and requires apparatus totally different from that used in pressure welding. In arc welding, as the name implies, the useful agent is the electric arc, and because of the characteristics of alternating current a steady arc cannot be drawn, since the alternating current varies from a maximum to a minimum at each reversal of the current. Therefore, direct current service is essential to electric arc welding. Since arc welding is an autogeneous process, in which the metals to be joined are brought to a state of fluidity, no pressure is necessary. The voltage required for arc welding is between 20 and 50 volts, while the current value varies from 15 to 600 amp., or upwards, depending upon the character of the work. The electric arc emits rays which are harmful to the eyes of the operator unless protected, and, therefore, face and hand shields, or both, form a part of the equipment for arc welding. The apparatus required for electric arc welding consists of a suitable source of direct current energy at the voltage and current value specified, means for controlling the value of the voltage and current, the electrode of metal or carbon or graphite for drawing the arc, and the face and hand shields.

Since direct current of special characteristics is required for arc welding, it has been found generally desirable to use an especially designed generator. Commercial voltages of 110 to 250 volts cannot be used economically, for the reason that in stepping down with direct current, resistance must be used which would absorb a large proportion of the available energy and make the use of current by this method extremely inefficient and expensive. Therefore, where electric power is available the source of energy for electric welding generally takes the form of a motor-generator set or dynamotor, the driving end being wound for operation on the electric service available, either from a central station or private generating plant, and the generator end being wound to give the special characteristics required for the welding arc. Where direct current is used in the plant, a dynamotor consisting of two sets of windings mounted in a single frame and running on a single shaft or a d. c. motor generator set may be used.

Arc Welding Processes

Before proceeding with a further description of the apparatus used and its application, a short discussion of the theory of arc welding and the various processes employed will be outlined to give a clear understanding of the apparatus used.

There are three general processes by means of which arc welding is carried out, named from the men who were responsible for their development. Two of these are in general use, while the third has a somewhat limited application.

Bernados Process

The Bernados process is especially adapted for large and heavy work. It consists of drawing an electric arc between the work and a single carbon or graphite electrode, and is the same as that known as carbon or carbo-graphite electrode welding. The arc is drawn by touching the electrode to the work and withdrawing it to the proper distance to maintain

similar to the action of an arc lamp when starting. The temperature of the arc is approximately 3,500 degrees C., and the heat is confined to a comparatively small space directly in contact with the arc. The intense heat of the arc on striking the filling metal causes it to melt rapidly and flow into place, and as the arc is moved over the work the filling metal and the molten metal of the work unite in an intimate mixture or weld. This process is principally used with large electrodes and heavy currents for heavy work on large pieces of metal, although by the use of small electrodes and low current values the process may be used in welding comparatively light material.

Slavianoff Process

This process is commonly known as metallic electrode welding, since it consists in using the work as one electrode, the hand of the operator. The electrode itself is therefore gradually consumed during the progress of the work. The arc is drawn by touching the work with the metal electrode and drawing it away until an arc of the correct intensity is obtained, in a manner similar to that followed with the Bernados process. In general, this method will make a softer weld than the Bernados process, since there is no tendency for carbon to be carried into the weld. Because of the action of the arc in carrying the metal from the electrode to the work it is possible to weld on a vertical wall or overhead, and for this reason the process is of great value where repairs are made to parts which cannot be removed and placed in a horizontal position.

Zerener Process

The Zerener process consists of an arrangement of the positive and negative carbon electrodes in a holder so that they form a "V," the arc being between the poles of a power-electro-magnet, which forces the arc toward the work. This causes the arc to act in a manner similar to the flame of a gas torch, but because of a certain sensitiveness, inefficiency, and complication the process is not used as extensively as the Bernados and Slavianoff processes. It is used to a limited extent for comparatively small work in steel and brass and for welding small corners in tubes and tanks.

Arc Welding Apparatus

As previously mentioned, the source of energy for arc welding is usually a special low voltage generator, since this is far more efficient and economical than the use of reduced voltage from a commercial supply line by means of resistance. The generator may be driven by a direct-connected motor where electric service is available or by belt from line shafting, or steam, gas, or gasoline engines in plants where electric service is not used.

The gradual refinement of electric arc welding apparatus has led to the development of two distinct types of generating equipment known as constant voltage welders and variable voltage welders. The manufacturers of each type set forth certain arguments as to the advantages of the particular system employed. The object to be attained is the maintenance of a constant temperature at the arc, regardless of variations in the length of the arc, which are bound to occur, due to the unsteadiness of the hand of the operator or the unevenness of the surface being worked upon.

Constant Voltage Welders

Constant voltage welders consist of direct current generators wound to deliver a voltage of approximately 60 to 75 volts, this current then passing through an adjustable resistance controlled by automatic magnetic switches and relays, or in some cases by hand or motor-operated switches or rheostats. In some types of constant voltage apparatus magnetic contactors operate the resistance in accordance with the drawing of the arc, so that when the operator brings his electrode into contact with the work the current is limited by all of the resistance in the circuit, but when he draws the arc the automatic contactor cuts out a part of the resistance and allows the current to come up to the amount required for welding. In another type of constant voltage welding apparatus, resistance is used, but automatic regulating devices are eliminated and dependence for the maintenance of constant current value is placed upon the automatic compensation, which occurs simultaneously with any change in the length of the arc. The theory is that the lengthening of the arc, intentionally or otherwise, introduces additional resistance into the welding circuit, thereby reducing the amount of current flowing. This, however, means that the voltage across the arc rises slightly. If the arc is shortened the reverse action takes place so that the heat produced, which is proportional to the product of current times voltage, will remain practically unchanged for any length of arc with which work can be done.

The constant voltage system is generally adapted for a number of welding circuits which are supplied by a single generator, each welding circuit being equipped with a welding control panel, which is mounted separately from the generator control panels. The generator control panels are not essentially different from the control panels supplied for the control of generators supplying power for lighting and general power purposes, since they carry indicating instruments, protective apparatus, and switches arranged for regulating the output of the generator. Separate outlet panels may be provided for each welding circuit, each panel carrying a circuit-breaker and line switch and the necessary resistance adjusting switches for regulating the heat of the arc by varying the amount of current supplied to the arc. Arrangements are made whereby one or more of the welding circuits may be operated simultaneously, the only limit being the capacity of the generator. Constant voltage generating equipment is also arranged for single welding circuits, in which case the welding control instruments and the generator control instruments are usually mounted on a single panel.

Variable Voltage Welders

This type of apparatus operates upon the theory that in arc welding the voltage of the current actually used is continually changing. At the moment the operator touches the electrode to the piece of work the voltage in the circuit is nearly zero, and as he draws the electrode away the voltage constantly increases as the arc lengthens. To produce this result the variable voltage generators are designed to deliver the exact voltage required at the arc at any particular moment. Ballast resistance for the regulation of the welding current is therefore not necessary in this case. The variation of the voltage is obtained by manipulation of the strength of the generator field by means of either hand-operated or magnetic switch and push-button-operated field rheostats, or by a separate electrical machine mounted on the same shaft as the generator and known as an exciter. As the resistance of the arc varies, due to the changes in its length, the voltage is varied proportionately, thus maintaining the value of the current at approximately a constant figure.

The variable voltage apparatus is generally supplied for a single welding circuit—that is, a generator set and the other equipment is provided for each operator. Where greater capacity is required than the capacity of the relatively small single circuit generator, the usual arrangement is to connect two generating units together and thus obtain the double capacity.

Portable Welding Apparatus

Electric arc welding apparatus may be used either in the shop where the various units are permanently installed or the complete equipment may readily be mounted upon a truck for portable operation. Portable welding apparatus for shop use is generally built upon a small truck, which may be moved by hand, while portable welding apparatus for use in

the field may be mounted upon motor trucks, or, when used by electric railways, is mounted upon small cars, which may be run from one place to another upon the tracks of the system. The portable shop welding apparatus is arranged so that the motor may be plugged in at convenient points where connections are provided so that a single welding equipment may be used in various parts of the shop as the progress of the work requires. Electric railways use portable arc welding equipment to a great extent in the repair and maintenance of tracks, in which case the motor end of the set is wound to operate upon the usual railway voltage. Portable outfits may be obtained for use where electric service is not available, the prime mover in such case generally consisting of a gasoline engine, which is direct connected or belted to the welding generator.

Auxiliary Welding Equipment

In addition to the motor generator set or other source of energy for welding and the arc control panels for the control of the equipment, the apparatus required for electric welding consists of the electrode holder and masks or shields for the protection of the operator's eyes, face, and hands.

The electrode holder is a handle provided with means for connecting the cable at one end and for clamping the carbon or metal electrode at the other end. Holders for carbon or graphite electrodes generally are provided with shields to protect the operator's hands, somewhat similar to the guard on a fencing foil. The face shield or mask is made of sheet metal generally, arranged with straps for fastening the mask over the operator's head. A lens of colored glass is inserted in the opening to neutralize the rays of the arc. In some types of apparatus for metallic electrode welding the shield is arranged to be held in the operator's hand, and does not strap over his head for the reason that with metallic electrode welding the operator uses only one hand, whereas with graphite electrode welding one hand holds the electrode and the other hand holds the piece of filling metal.

Electrical Developments During 1917

In accordance with their usual policy the Westinghouse Electric & Manufacturing Company have sent out a review of developments in electrical apparatus as manufactured by the company during the year 1917. It is noted that the unprecedented demand for apparatus and appliances has called for abnormal efforts to speed up production and this has left little time or energy to be devoted to the development of new apparatus or modifications of existing types. The year, however, has not been barren of developments, and the most important of these are given briefly in the article which follows:—

Generating Equipment

The past year has seen little that is radically new in generating equipment. More units of large individual capacity have been contracted for than ever before, due to the growth of the larger central stations. The Westinghouse Company has sold several large units ranging from 40,000 to 70,000 kw. capacity and these either have or are now being installed. Those units above 40,000 kw. are of the cross compound or triple element type. Among those reported last year but just recently installed may be mentioned the Duquesne Light Company, Pittsburgh, a 40,000 kw. cross compound unit; Narragansett Electric Company, Providence, a 45,000 kw. cross compound unit; and the Interborough Rapid Transit Company, New York, a 70,000 kw. triple element unit.

One of the developments brought about by the high cost of materials, labor, etc., such as the high cost of copper, has been an increased tendency towards the use of synchronous condensers for both power factor correction and voltage regulation. In many cases the installation of such apparatus saves an increase in transmission line copper, or allows additional load to be taken on a given transmission line, and at the same time permits the maintaining of normal and satisfactory voltage conditions.

There may be mentioned the completion of a number of 150,000-volt outdoor oil circuit-breakers of rupturing capacities far in advance of anything heretofore within the limits of high voltage breakers. These breakers have round instead of elliptical tanks, domed instead of almost flat tops, and are of all steel construction, with the result that guarantees of their withstanding possible internal pressures of 190 pounds have proven very conservative. In fact, with the guaranteed arc rupturing capacity with voltage maintained of 1,000,000 kv.a. it is felt that questions of high-voltage power concentration is solved for at least some time. Similar breakers with same guarantees are also being built for 110,000 volt service.

Among other developments might be cited the frame-mounted, indoor and outdoor high powered steel top, 73,000 volt breaker; combination 37,500 volt and 132,000 volt outdoor, single-pole, disconnecting switches and choke coils all on a common base with a resulting net saving of one insulator supporting column; and 66,000 volt post-type bus supports and disconnecting switches.

Typical of the attention constantly being given to improvement in switchboard mounting devices is the development of a very compact and improved drum type circuit-breaker controller. Likewise along the same lines may be mentioned the completion of an adequate line of meter switches (also of drum type), key operated, including ammeter, voltmeter, synchronizing frequency meter and power factor meter switches. With the completion of these, all plug switches for meter switching can be eliminated, thus insuring the entire absence of any potential from the front of panel boards or control desks.

Increased use of outdoor switch houses has been noted; a considerable number of installations have now been made which control circuits up to 6600 and 11,000 volts. Single orders received involving as many as ten houses are proof of claims made as to the economy represented by their use for distributing small amounts of secondary voltage power from transmission lines in connection with outdoor step-down transformers.

There may also be mentioned the development of what gives promise of being a highly successful and yet simple control equipment for automatic rotary converter sub-stations. One such outfit has been in successful operation for some time and others are under construction. To a very large degree, the bulk and complexity of earlier control equipment for such installations have been eliminated.

Lightning Arresters

The principal change in electrolytic arrester design has been in the main gap. The use of sphere gaps in combination with horns first came into use as a special design, and later was adopted as standard by all manufacturers on all

down the gap and discharge to ground through the arrester. For the protection of apparatus on railway cars further developments have been made in the use of condensers by surrounding the condenser with a moulded insulating case, making an easily replacable unit impervious to moisture. The capacitance has been increased to 1 mf. in all forms of arresters, both car mounting and pole mounting, giving a static discharge capacity sufficient to take care of the worst conditions found in practice.

Oil Circuit Breakers

The tendency towards the development of breakers of very large interrupting capacity at all ranges of voltage has continued during the year, in order to take care of the increases in generating capacity throughout the country. The requirements of the situation have produced breakers for use up to 155,000 volts having the capacity to interrupt 3750 amperes at the contacts. This line consists of round tank breakers from 95,000 to 155,000 volts, having domed steel tops and bottoms with operating mechanisms inside the top, thus securing maximum strength in all directions against internal stresses.

Motor Operated Graphic Instruments

A line of motor operated graphic instruments has been added to the Westinghouse line of solenoid operated instruments in order to make the line more applicable for portable service and for metering large customers' demands. These instruments are made as a.c. and d.c. voltmeters, a.c. and d.c. ammeters, a.c. wattmeters, totalizing wattmeters, and frequency meters. They embody the same measuring element as used in the solenoid operated type instruments and, therefore, have the same accuracy characteristics. They differ from the previous line of solenoid control instruments, in that the contacts of the measuring element actuate a small universal motor, driving a worm upon which the pen carriage is arranged to travel. The case is also somewhat smaller and designed for rear connection. The clock is so arranged that the standard paper speeds can be obtained without changing it.

Sub-stations

The developments in sub-station apparatus have been relatively small, due to the great amount of active business, making it almost impossible to even put through experimental work contemplated. Various improvements in details of converting apparatus have been made, which tend towards better sub-station apparatus ventilation, lower maintenance, longer life, and better economy. The outstanding feature in the past year has been the production of sub-station switching equipment, that is entirely automatic. This equipment switches the apparatus on a fundamentally sound basis, that is, the machines are switched at the proper time, depending upon the electrical condition of the machine controlled. There has been little doubt as to the value of attendantless sub-stations, the only doubts having been the lack of sufficiently reliable automatic equipment. This new development, therefore, should be of inestimable value to the electric railway industry.

Street Lighting

The most notable addition to street lighting during the year is a fixture for the high current street series lamps of large candlepower. It is made of cast iron and is suitable for either auto transformer or film cut-out socket. Similar fixtures, which have been in service several years, indicate that this is a very desirable modification, as the cost of equipment can be reduced without sacrificing any desirable qualities. The increased use of the skirted type of Holophane refractor with fixtures for street lighting service, indicates the growing appreciation of the ideal distribution given by this simple device.

Street Railways

During the past year the standard line of Westinghouse railway motors has been supplemented by the type 577 motor, having a rating of 200 h.p. at 800 volts. This motor is especially suited for heavy subway service, and a large number are now going into service. It lends itself to heavy interurban service where exceptionally heavy duty is required, and is in striking contrast to the "Wee" motor brought out by the company, which is the pioneer motor in quick service single truck car application. It is gratifying to note and of decided advantage to the trade to report stability in design of the present line which enables the user to standardize for some time to come. The multiple unit types of control previously reported are coming into their own. Scarcity of labor and heavy peak load haul has now convinced the user of the advantage to be obtained.

Regeneration has been extended to ordinary interurban application, especially in locomotive service, and this development will rapidly extend in this field.

The past year has seen considerable detail development and improvement in apparatus pertaining to electrification of steam railroads. The requirements for heavy freight traffic on mountain grade sections have been met by the production of a very powerful split phase locomotive motor having several improvements over those previously built. This locomotive, while only weighing 250 tons complete, has a horse-power capacity of 4,800, and a maximum tractive effort of 130,000 lbs., all of which is concentrated in one single unit. The most interesting improvement in this type of locomotive is the synchronous phase converter, by which 100 per cent. power-factor is obtained, thus eliminating some of the line losses which were encountered with the induction type phase converter.

The high voltage direct current system has also shown advance in the production of a high powered passenger locomotive. The rating of this locomotive will be 4,000 horsepower and the starting tractive effort will be 112,000 lbs., while the total weight will be 266 tons. This engine will also be a single cab unit.

Regenerative control for direct current locomotives has been perfected to such an extent that it is now applied whenever desired to 600 volt units as a standard. This feature contributes very largely to the safety in operation of the electric locomotive, and its principal value lies in the fact that it relieves the air brakes from considerable strain and enables them to be used as a reserve for stopping trains only.

The development of high speed circuit-breaker methods for suppressing flashing in high voltage direct-current apparatus has taken very forward steps during the past year and the indications are that this serious trouble in machines of this class has been definitely suppressed. These devices are of various kinds and very unique in character, the details of which will receive publicity at a later date. These detail developments have put the electrical industry in a position of preparedness for the more general electrification of railroads, which it is anticipated will become very active in the near future.

The Steel Industry

The electrification of steel mills is progressing at a very rapid rate. The business of the company during 1916 and 1917 is more than three times as great as for the average of the five previous years. During the past year the company received an order for one of the largest reversing mill equipments ever built, this machine having a maximum rating of 17,500 h.p., and will be used to drive a 60-inch universal plate mill for the Bethlehem Steel Company.

Rubber Industry

There has been developed during 1917 what is known as a tandem type controller for calender work, which is of

the magnetic switch type and is controlled from a push button station. Besides the convenience offered by the latter, it adds to the safety feature, as the motor can be stopped from various stations conveniently located to the operator. Other safety features are included affording overload protection, automatic acceleration, etc. In this particular case, the calenders are located in tandem, in some cases as many as four machines being operated in series. With the old arrangement of drive, the calenders were operated as individual units, and after the process in each individual calender was completed, the material had to be wrapped up and taken to the next machine, and the work thus carried on independently by the various machines. With the new arrangement, the material passes from one machine to the other in a continuous process which saves time, labor and materially increases production. The control mentioned above makes possible the proper regulation of drive, and is considered a great improvement in rubber mill work.

Textile Industry

A new type of apparatus developed this year which is used extensively in the textile industry is a quick make starting switch. It is used where squirrel cage motors of comparatively small capacity, i.e., up to 25 h.p. max. 220 volts are started with full line voltage. Besides the quick make and break features, it has the following combinations: non-automatic switch; switch with low voltage protections; switch with inverse time element overload protection; full automatic switch with low-voltage and inverse time element overload protection.

There has been a marked tendency during the year for the textile industry to install individual drives, as compared with group drives, and it is believed that very rapid progress is going to be made in the development of this idea. There have also been a large number of plants changed over to electric drive—in practically all cases using central station power.

Small Motor Drive Devices

The business in small-motor-driven devices used in the home, office, and shop during the last year has been very active. As in all other industries, the activity has been more pronounced in connection with those motor-driven devices which contribute either directly or indirectly to the carrying on of the war. For instance, there has been a large sale of motor-driven drills, grinders, polishers, and small tools generally. This has also been true in the case of motor-driven machines required in the preparation of food and those in the home which are distinct labor savers, such as electrically-driven washing machines. The extreme scarcity of household help has created a very large demand for these. On the other hand, the demand for non-essentials, such as motor-driven pianos, talking and recording machines, office appliances and advertising novelties have become less active.

Electric Vehicles

In the electric vehicle industry, the principal activity has been in industrial trucks used in factories and other munition plants. The total demand for pleasure vehicles has been quite small.

General Industrial

In the industry covering the equipment of electrical apparatus for public buildings, there has been a great deal of activity, due principally to that of industrial rather than public buildings. It appears quite likely that the public building and residence industry will be very severely affected, in fact this is already noticeable. Considerable electrical apparatus has been purchased by bakers and all those engaged in the manufacture or preserving of food products. Likewise, the clothing industry has been a very active one.

The Farm

The prosperity of the farmer and the scarcity of labor on the farm has made an abnormally large demand for electrical equipment in the comparatively small areas where central station current is available, and particularly in the demand for small isolated lighting plants, many of which are supplied with storage batteries. This has resulted in demand for low voltage motor-driven pumps, washing machines, vacuum cleaners, churns, separators, and similar devices.

Arc Welding

The advance made in the past year in arc welding has been important. Heretofore, the arc welding voltage has been 75, but the company has recently designed a new line of arc welding equipment with an operating voltage of 60 volts, and also the machines are running at the highest and most efficient speeds. The drop in voltage from 75 to 60 will mean a saving in power. Further, this company has developed portable welding outlet panels which will simplify the shop wiring and will decrease the total expense of the installation.

Metal Mining

As in other industries this year, in the metal mining field there has been developed a control panel offered where a wound rotor motor is used. It combines a circuit-breaker controller and meter in conveniently small space and prevents the motor being thrown on the line without resistance in the secondary circuit. Several new ratings of Cottrell equipment, including motor generator sets, transformers, and synchronous induction motors were brought out during the year so that a standard equipment to meet most commercial conditions can be furnished. For the flywheel hoisting sets, the greatest improvement has been in a control, as the cam type controller for the generator field rather than the old face plate type is furnished.

The company has brought out a complete line of semi-automatic ranges, which have a contact thermostat on the oven doors that rings a bell when a predetermined temperature is reached which may be varied by manually setting the contact point on the thermostat. This prevents the housewife from scorching foods, as the bell calls her attention to the fact that the maximum temperature has been reached and the current should be turned off. This alarm, of course, also prevents overheating of the oven lining, and rapid deterioration. This line of ranges supplements the full automatic ranges which are arranged for automatic turning of the current on and off.

Personal

Mr. M. C. Gilman, sales manager of the Toronto Electric Light Company, has been appointed secretary-treasurer of the Canadian Electrical Association, succeeding Mr. Alan Sullivan, who resigned recently to go overseas.

Mr. John N. Timberlake has resigned his position as power apparatus sales engineer, Northern Electric Company, on his appointment as Montreal district sales manager of R. E. T. Pringle, Ltd., with an office at 401 New Birks Bldg.

Mr. R. H. Balfour, sales manager of the Eugene F. Phillips Electrical Works, Limited, Montreal, has been elected a director of the company. The capital of the company has been increased to $4,000,000, and a new charter, with more extensive powers, obtained.

Mr. W. J. Wilkinson, formerly manager of the Northern System of the Ontario Hydro Commission, with headquarters at North Bay, has resigned to accept a position as manager of the North Bay Toy Company. H. D. Rothwell, one of the Commission's engineers employed in the Municipal Department, succeeds Mr. Wilkinson.

Transmission Line Practice—Conductors

By Lieut. E. T. Driver, B.Sc., and E. V. Pannell, Assoc. I.E.E.

[Never did a more urgent demand exist for cheap and plentiful electrical energy than at the present time. The manufacture of munitions of war, the production of nitrogen compounds for explosives and for stimulating natural food resources and the conservation of fuel all call for electricity cheaply generated and transmitted most efficiently and economically from the falls to the factory. In this connection we have arranged for a series of articles on the economics of transmission, of which the present and first one deals with conductors.—Editor].

ARTICLE I.—CONDUCTORS

Although wires or cables of copper or aluminium constitute by far the majority of the conductors in use for transmission line work, the last few years have seen the introduction of certain conducting materials of greater diversity and better adapted for special conditions. It will be of interest as an introduction to a series of articles on transmission line engineering to consider, side by side, all the various materials in use at the present time as conductors. These may be divided into three groups: (a) Simple materials; (b) compound materials, and (c) alloys. In class (a) are copper, aluminium and steel (steel is, properly speaking, an alloy, but it is more convenient in the present connection to consider it as a simple metal). Class (b) comprises copper-clad steel, hemp core copper and aluminium-steel, and class (c) includes the light aluminium alloys and bronze. It is most logical to compare these different cables on the basis of conductance; as a rule the losses in the line are the determining factor and a wire or cable of a certain definite number of ohms per mile is the starting point in the comparison. Copper has been assumed as the standard conductor and the other materials lined up with it.

Copper

The oldest and still the most important material in use as a conductor needs little introduction. The manufacture of copper wire or cable for transmission line work may be outlined briefly as follows: Electrolytically refined metal of 99.9 per cent. purity is received by the mills in the form of cast billets weighing around 250 pounds each and being about eight inches square in section. The shape of the wire bars is practically a square prism with rounded corners and slightly convex sides to enable the breaking down rolls to take a firm pinch. Rolling takes place whilst the bars are hot from the re-heating furnace and the maximum amount of work is put upon the metal with a view to securing wire of high physical quality. The section of the rods during the running-down changes from square to diamond, then to an oval, round and oval successively so that the interior fibres of the metal are thoroughly worked. This procedure, together with a reasonably large number of passes, secures the utmost strength and elasticity possible to attain. When the rods are rolled down to .375 or slightly smaller they will be nearly one thousand feet long and they are then coiled and sent on to the wire-mill, being first pickled and tumbled to remove the scale, after which further reductions are made upon the wire-blocks. Drawing copper wire usually takes the form of one pass for each number on the B&S scale so that wire of 10 B&S will probably take twelve passes from the rod. After every half-dozen or so passes it will be necessary to anneal the wire, and if the product is required to be soft it will be annealed within one or two passes of the finishing block. It is now general to anneal copper and other metals in a water-seal muffle. In this process the coils of wire on a belt conveyor travel through a water trap when entering and leaving the heating chamber. Air is therefore excluded and no scale is formed on the metal. Hard drawn copper wire of the quality requisite for transmission work having a tensile strength of 50,000 to 60,000 lbs. per square inch generally has several high speed finishing passes after the last anneal. After finishing it is laid up in a strander to 7, 19, 37 or, for exceptionally large sizes, 61 wire cables, is reeled, and is then ready for test and acceptance.

Aluminium

The foregoing processes apply not only to the manufacture of copper cables, but also with slight modifications to wires of aluminium and all other metals. Aluminium is not produced in a smelter and electrolytically refined like copper, but is actually reduced by an electrolytic process. The metal blocks are then graded and those showing over 99.4 per cent. purity are reserved for electrical work. They are cast into wire bars of precisely the same shape as copper, but owing to the lower density of aluminium the bars of the same size are somewhat less than one-third the weight of copper. Ninety pounds is a standard aluminium wire billet. The billets are rolled down when hot by the two-stage process, as described for copper, and where material of extremely high tensile strength is required the finishing pass is sometimes given when the rod is practically cold at very high speed. This sometimes leads to trouble on the wire blocks, however, and it is better that the rods should be as soft as possible when they reach the wire mill and that extra high strength be attained by extra passes. Rods of .500 and .375 are passed direct from the rolls to the wire-blocks, there being no scale to remove by pickling or tumbling. Moreover, the wire can be reduced three times as many passes as copper between anneals. However, the bulk per pound is more than three times as great as copper so that the costs of manufacture per pound are slightly higher for aluminium. The tensile strength and conductivity can be varied, and as with copper, the softer the wire the higher will be its conductance. The best compromise is reached with metal of 60 per cent. the conductance of soft copper; higher values than this can only be attained at the cost of tensile strength.

Steel

The occasional use of a ferrous metal for transmission lines has been dictated for two entirely different reasons. In general it has been found undesirable to use copper or aluminium on spans greater than about 2,000 feet in length; to secure a reasonably small sag, wires of high tensile plow-steel are strung on such crossings. In this case the distance run by the steel conductors is so short compared with the total length of the line that the reactance of the steel is negligible. On the other hand, iron and steel wires have been employed in recent years for purely economic reasons, and in some countries because of the scarcity of copper. In this latter circumstance the reactance of the steel has naturally been a most troublesome factor to take care of. Many small branch distributing lines are being operated in America with steel wires. In these cases the resistance of the smallest practicable copper wire would be much lower than necessary and iron or steel wire of the same size carries the load quite satisfactorily without excessive voltage drop. The chief disadvantage of the ferrous material, according to recent reports, appears to be deterioration.

The increased resistance of steel wires is due to a num-

ber of factors, the most important of which is the skin effect. The magnetic field in the conductor confines the current to the outer layers and the effect is more accentuated the higher the permeability of the steel. This high current density near the surface results in a high temperature rise and still greater ohmic resistance. It has been found that vastly improved characteristics result from the use of an outer skin drawn or laid over the steel conductor; such layer need not necessarily be of copper, but it should be a non-magnetic metal. This envelope will carry the current which is forced into the outer layers by the magnetic effect in the core, but its use brings the cable into the class of composite materials.

Copper-Clad Steel

Since the physical constants of copper and aluminium do not permit of these metals being strung upon the longest spans without the use of very high towers, and since the electrical properties of steel are still more unsatisfactory, there is reason to believe that future transmission lines will be very largely strung with composite conductors. Copper-clad steel was the first of these to attain any extended use. The conductor consists of a central core of steel surrounded by an annular jacket of copper. The method of manufacture involves casting or driving the copper jacket around the steel in the wirebar stage, all subsequent operations being made upon the compound material. It is claimed that the copper is actually welded to the steel, forming an alloy at the junction of the two. Copper-clad is not, nor is it claimed to be, an economical competitor of copper for long distance transmission because for a given conductance it is necessarily more expensive by the cost of the steel and the operations involved. Moreover, the method of manufacture requires that the percentage of steel to the total area shall be large, and for this reason the reactance will be undesirably high. However, this is partly balanced by the fact that due to the higher tenacity and the smaller sags the wires could be more closely spaced.

Two grades of copper clad steel are commonly used, known as 30 and 40 per cent., these figures being the conductance as related to annealed copper of the same size. It is usual to neglect the steel in conductance calculations and these figures therefore represent the percentage of copper in the total cross section of the wire. For nearly every class of electrical work the 40 per cent. grade is specified, its resistance and reactance being lower than the 30 per cent. class, whilst the mechanical characteristics are very high.

Hemp-Core Copper

This need hardly be considered as a special type of conductor because it involves merely the substitution of a hemp strand for the middle wire of a seven strand cable. There will thus be only six wires carrying current, and the cable is 16 per cent. greater in gross cross section than the equivalent seven strand copper. The hemp core will elongate to any reasonable amount and the load is carried wholly by the outer wires. However, the hemp is inelastic to a certain extent, and does not contract to the same degree as it elongates; in certain instances deterioration of the core has led to distortion of the cable. One reason sometimes adduced for the use of hemp-core copper on very high voltage installations is that the increased diameter of the cable increases the effective disruptive voltage and reduces the liability of corona; on the other hand, deterioration of the hemp causes small nodules to project between the wires, and these have been found actually to act as discharge points for corona. In general it has been found that a superior form of conductor has been produced by discarding the hemp core and using instead a middle wire of medium drawn copper which is sufficiently annealed to elongate and transfer the stress to the outer envelope.

It should be mentioned that hemp or annealed cores are only used with seven wire cable. Where a larger number of strands is employed no such large proportion of the tension comes upon the middle wire and all the strands can be of exactly the same material and temper.

Aluminium-Steel

Following on the introduction of copper-clad wire, the attempt was made to cast an aluminium jacket around a steel billet in the same manner. The experiment was not successful because of the great disparity between the melting points of the two metals; however, the problem was solved

TABLE I.—PROPERTIES OF TRANSMISSION CONDUCTORS.

These figures refer to wires from No. 6 to No. 14 B&S, Temp. 20° C.

by a more simple device. It was found to be not only practicable but entirely satisfactory if the individual aluminium wires were laid up around a steel core in an ordinary stranding machine. The steel wires are generally double galvanized and as there is little difference between the electro-positive properties of aluminium and zinc there is little or no opportunity of electrolysis as long as the galvanizing is intact. It is not absolutely necessary, but it is usual for the ordinary stranding scheme to be carried out; that is, in a seven wire cable the middle one will be of steel (sometimes seven small steel wires having the same total area) and the outer six of aluminium. In a thirty-seven or sixty-one wire cable the centre seven will be of steel. The ratio of steel to aluminium, therefore, is not always the same, and the properties of the compound conductor have to be calculated for the particular ratio in use.

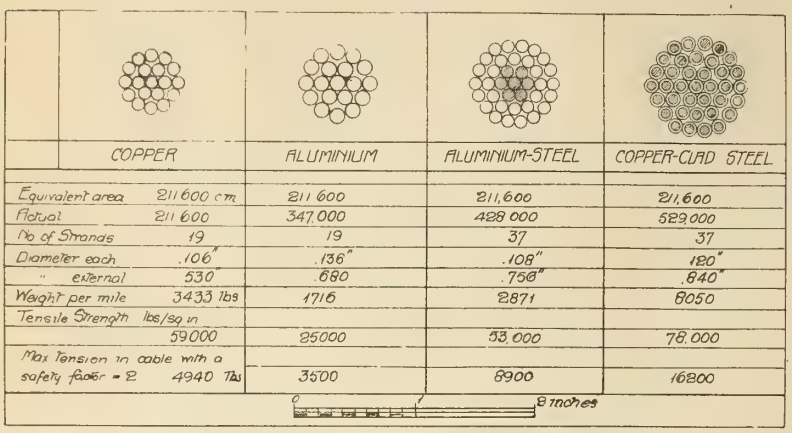

Fig. 1—Comparison of different transmission conductors, 4/0 equivalent

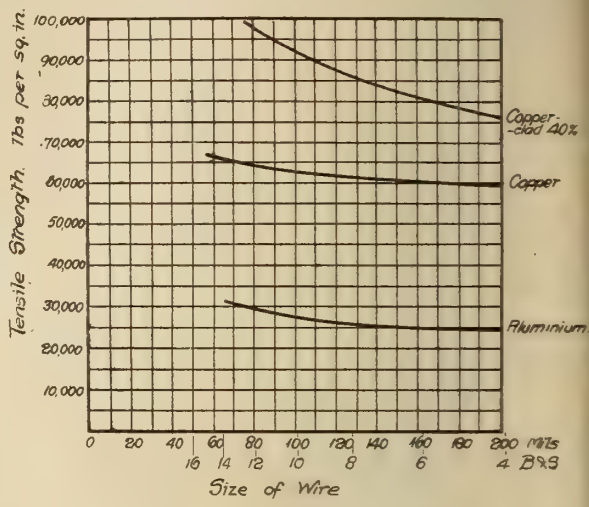

Fig. 2—Tensile strength of wire.

Aluminium Alloys

The maximum tensile strength of hard drawn copper wires as ordinarily used for transmission work is 60,000 lbs. per square inch, whilst that of aluminium in the pure state is about 30,000 lbs. When alloyed with a small percentage of copper or nickel the tenacity of aluminium can be increased by fifty per cent., and this has seemed to represent a more satisfactory solution of the problem of stringing long spans than the use of pure aluminium. A special alloy used for long span transmission work in Norway had the composition Al, 97.35, Cu. 1.85. The tensile strength of this wire is 42,000 lbs. per square inch and the elongation 5 per cent. on 2 inches. However, certain grave disadvantages attend the use of this material. Very simple tests have shown that destructive corrosion takes place under ordinary atmospheric influences. In addition to this the conductance is only 50 per cent. that of soft copper, whereas pure aluminium gives 60 per cent.; in other words, the alloy wires must be 20 per cent. larger and, due to its greater density, probably 35 per cent. heavier than the equivalent pure metal. In its advantages it is on a par with aluminium-steel, but it will be more costly and more liable to give corrosion troubles.

Bronze

This metal has attained little vogue in America, but is employed to some extent in Europe, particularly for river crossing spans, there being a certain amount of prejudice against the use of steel wires in this connection. The permissible tension may be considerably higher than is the case with copper, depending upon the percentage of phosphor and silicon. The material generally used has a tensile strength of from 70,000 to 110,000 lbs. per square inch, the conductance is generally less than half that of pure copper, however. Obviously this alloy is restricted in its use to such circumstances as call for tensile strength of a high order without regard to conductance. No advantage would be gained by stringing long transmission lines in bronze because 50 per cent. conductance would call for an increase of 100 per cent. in weight, which would only just be balanced by the 100 per cent. increase in tensile strength. Moreover, there is always a certain risk of crystallization in using alloys on long spans, with their inevitable oscillations, and it is unlikely that even in Europe will any further installations be strung with alloys of this nature.

All the various conductors available for transmission have been briefly summarized above, and in Table I. will be found the properties, corrected from the most authentic sources, of all those whose characteristics are reasonably satisfactory in the light of our present knowledge of the subject. Nothing can show more clearly the relative advantages and disadvantages of the various conductors than a comparison of their properties in the table. It would appear that the simple materials, copper and aluminium offer the best advantages from the electrical standpoint, but that the compound conductors, copper clad and aluminium steel give the best compromise between electrical and physical properties. The full value of high tenacity conductors is not seen until the problem of sags and heights of tower are considered. In Fig. 1 are shown four entirely different types of conductor, all equivalent to 4/0 copper; their sizes and other properties are therefore all compared on the basis of equal conductance.

The second article of this series will appear in our issue of February 1, and will deal with "Sag and Span Problems."

New Cars for the Sandwich, Windsor & Amherstburg Railway System

A number of cars with Kuhlman standard steel-frame bodies, "Renitent" post construction and plain arched roof, and arranged for single-end operation, have lately been placed in service on the lines of the Sandwich, Windsor & Amherstburg Railway Company, of Windsor, Ont.

As will be seen by the floor plan, the cars are for single-end operation, and have a smoking compartment at the forward end. The total seating capacity is 46, ten being accommodated by longitudinal seats in the smoking compartment.

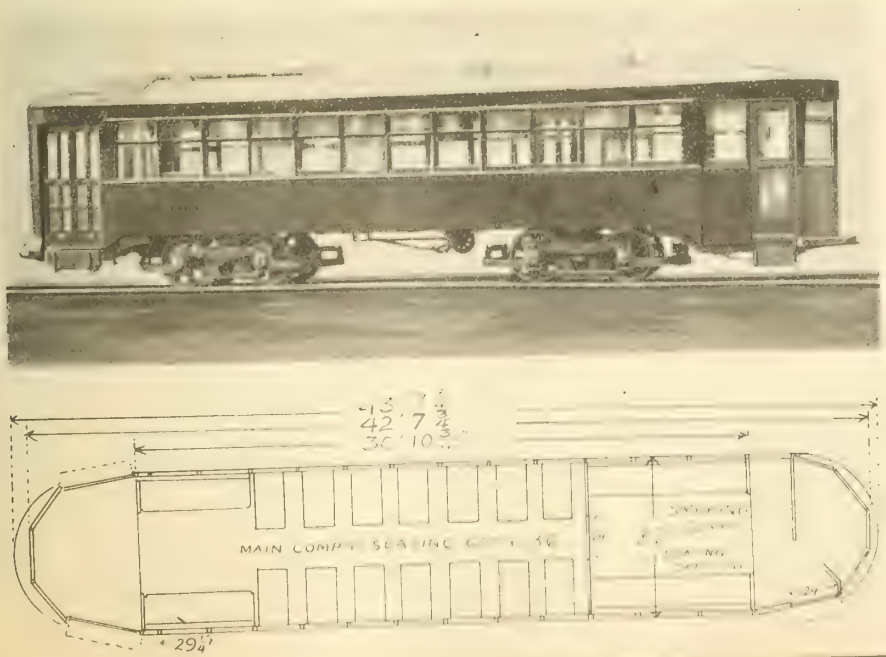
The end frame is made up of 5 by 3 by 5/16-in. angle side sills, open box type end sills made of No. 12 United States gauge steel, approximately 12 inches in width, having flanges turned on the bottom and riveted to the side sills; the crossings consist of 3-inch I-beams attached to the bottom flange of the side sills; the bolsters are of the built-up open-truss form. The platform framing consists of 7 by 3½ by ½-in. angle outside knees and drawbar sills of 5 by 4 by ½-in. angle; the latter extended from the face of the bumper to the end sill.

The entire side of the cars, together with the side sill angle, forms a girder which transmits the entire load to bolsters. An angle top-plate of 3 by 3 by ¼ in. and a plate-rail of pressed shape are secured to 2 by 1½-inch posts. Side plates of 3/32-inch steel are applied in three sections to a side. The letter-panel plate is of ⅛-inch pressed steel.

The roof is of the plain arch type and of the form known as the Kuhlman "true radius" pattern. The roof frame consists of angle top-plates with the horizontal leg turned in, steel carlines with a foot forged at each end for riveting to the vertical leg of the top-plate.

Open bulkheads forming an arch at each end of the car have pipe stanchions and railings which serve as grab handles. These bulkheads, and other parts covered with wood, are finished in quarter-sawed white oak. The headlinings are of composition material and the side and end wainscoting is of sheet steel. A partition of quarter-sawed white oak separates the smoking compartment from the main compartment and is fitted with a swinging door. Both sides of the partition and the door are glazed in the upper parts. A smaller partition, with door placed diagonally, forms the motorman's cab on the front platform.

The window posts are of the Brill "Renitent" type with spring brass casings. All the side window sashes, with the exception of one at the centre which is fitted with a destination sign, are arranged to raise their full height and have wire screen guards attached to the bottom rail of the sashes, which guards are concealed in pockets in the side walls when the sashes are in the lowered position. The upper sashes are stationary and are framed in a continuous piece. Brill



Interior new S. W. & A. cars.

stationary-back seats upholstered with canvas-lined woven rattan, are employed in the main compartment, and longitudinal seats of the same manufacture are used in the smoking compartment and at the rear of the main compartment.

At the front end the door of the sliding type, operates in unison with the folding step, and is controlled by manually operated devices from the motorman's position. The rear doors are of the double two-leaf folding type, hinged to fold at each side of the door opening, and operated by a pneumatic device from any point in the car, or from either platform.

The cars are mounted on Brill 51-E1 trucks with wheel base of 4 ft. 6 ins. and 33-in. wheels. These trucks have Brill solid forged side frames.

Steel construction, designed for single end operation on Sandwich, Windsor & Amherstburg Railway System. Total seating capacity 46. For city and suburban service.

The Dealer and Contractor

The Ontario Hydro Issues Amendments to Their Rules and Regulations—Will Standardize 660 Volt Key Sockets

We reproduce below a copy of amendments recently approved by Order in Council, to the Fourth Edition of the Rules and Regulations of the Hydro-electric Power Commission of Ontario. It is interesting to note that the Commission has ruled that the word "approved," when used in connection with compensators, is interpreted to mean that they must be provided with "no-voltage release." The Commission has also instructed the Inspection Department to take steps to standardize 660-volt key sockets as quickly as may be possible.

The following amendments of the Rules and Regulations, Fourth Edition, have been made and approved by Order-in-Council:

Clause (e), Page xii, Preface:

e. Electrical contractors, wiremen or other persons about to carry out any installation work must notify the Commission. The notice must be in writing on the form provided for the purpose by the Commission and must be accompanied by the amount of the fees in accordance with the "Schedule of Fees" published herein.

Add a new rule h. on Page xii of the Preface to read as follows:

h. No new installation, alterations or additions shall be connected to any service or other source of electrical energy to any service or other source of electrical energy by any supply authority, an owner of premises or by any other firm or person until the work has been duly inspected and a certificate issued authorizing the supply of electrical energy.

Change first rule on page xiii of the Preface from rule h. to rule i.

Page 18. A.C. Motors.

Commencing at the semicolon on the 4th line of the first paragraph under this heading and going down to the words "starting position" at the end of the sentence, rewrite, as follows:

"Where it is necessary to fuse the circuit beyond this limit and in sizes up to and not including 5 h.p. they must be started with an approved form of double-throw switch (unless some different but equivalent device be used) plainly indicating the starting and running sides and so constructed that a switch cannot be thrown on to the running side without first being put on the starting side, and so that it cannot be accidentally left in the starting position."

Add a new paragraph under rule f., Page 26, to read as follows:

Fuse holders must not be filled with other than approved fuses of the proper carrying capacity or must not be bridged with wire or other objectionable material.

Page 51.

Replace the 2nd paragraph of the explanatory note under rule (a) with the following:

"Except where permission has been granted to the contrary, the arrangement of cutout and switch must be such that the service wires first enter the latter."

In Rule (g), Page 54, strike out the words "not less than ¾ in. internal diameter and must be," and add the following as an explanatory note:

"Owners and others are strongly urged to call for not less than ¾ in. service pipe so that larger service wires may readily be drawn in at some future time should the introduction of electric ranges or other apparatus necessitate the provision of such larger wires."

Add the following note to Rule (i), Page 73:

"Special permission may be given for the use of varnished cambric insulation in dry or other suitable locations."

Amend Rule (c), Page 76, by striking out the period at the end of the rule and adding the following words:

"Or approved double-braided, rubber-covered conductors may, in certain permanently dry locations be used in conduit, under special permit in writing from the Commission."

Take out the whole of Rule (b), Sections 1, 2 and 3, on Pages 87 and 88, and replace it with the following:

"The supply for electric emergency lights must be taken either from a source separate from that furnishing other electric service in the building, or else it must be taken from a point on the generator side of the main cutouts or circuit breakers, used for other purposes of supply from the same source."

Where electric emergency lights are used, it is desirable that these be fed from a source of supply entirely separate from that used for other purposes.

Such a source may be outside or it may be a generating plant or storage battery inside the building.

If a separate source be not available then the supply for electric emergency lights must be taken from the generator side of the main service cutouts.

In every case emergency lighting circuits must be provided with their own cutouts.

Under no circumstances must emergency lighting circuits be used to supply current to anything but the **"emergency lights."**

By "Emergency Lights" is meant exit lights, and all lights in lobbies, stairways, corridors and other portions of a theatre to which the public has access, which are normally kept lighted during a performance.

Replace Rule (e), Page 88, with the following:

"Must be of the dead-front type and made of incombustible, non-absorptive insulating material. Plans of each board are to be approved before installation."

The whole section under the caption of "Moving Picture Equipments" is stricken out and the following clauses inserted under a new caption, "Moving Picture Booths."

w. 1. Conductors to moving picture machines must in no case be less than No. 6, B. & S. gauge copper wire.

2. The location and approval of rheostats to be under the control of the Inspector of Moving Picture Theatres, but all wiring and installation rules in connection therewith to be under the Hydro-electric Power Commission Inspection Department.

3. Cutouts and switches inside the booth must be of an approved type and so designed and installed as to eliminate possibility of shock or danger from fire.

4. All lamp cord to be approved reinforced cord and provided with wire guards and weatherproof sockets.

5. No open wiring will be permitted except leads to lamps and apparatus.

6. All other details of electrical construction must conform to such rules as apply.

After Rule (e), Page 102, to read as follows:

"Wires may enter buildings through incombustible, non-absorptive, insulating bushings sloping upwards from the outside or through conduit as required for electric light service (see Rule (g), Page 54)."

After Rule (b), Section 3, Page 121, to read as follows:

"Ground connections must be at the transformers and must also be made at individual services inside buildings when required by the Commission.

"When transformers feed systems having a neutral wire, such wire must also be grounded at least every 500 feet."

New Code Rule will Require Polarized Wiring

At the recent meeting of the Electrical Committee of the National Fire Protection Association for revision for the next edition of the National Electrical Code, it was voted to change Rule 26a as follows:

"The neutral conductor of all three-wire circuits and one conductor on all two-wire circuits must have an identifying insulating covering readily distinguishing it from other wires. This wire must be run without transposition throughout the entire installation and properly connected at all fittings to properly identified terminals in order to preserve its continuity. When one of the circuit wires is to be grounded, the ground connection must be made to this identified wire and as prescribed in Rule 15 and 15A."

This rule will appear in the new edition of the Code, to be known as the 1918 edition, and does not become effective until January 1, 1919. All fittings having wire terminals, such as sockets, receptacles, cut-out bases, attachment plugs, etc., must have some identifying mark to enable them to be easily connected with the proper terminal. Therefore, the organization known as the Associated Manufacturers of Electrical Supplies has submitted the matter to members of all of its sections covering the devices affected, asking that proper committees be appointed to consider the matter and report results at as early a date as possible, in order that they may be fully prepared for the new order of rules when in effect January 1, 1919.

Contractors Co-operate and Succeed

An excellent example of the fruits of co-operation is shown in the splendid Christmas advertisements of the Telephone City Electric Club, one of which is reproduced herewith. This was a full-page spread in the Brantford Courier and, occupying such prominent space, would naturally attract the attention of every reader of this paper. It is one of the best possible examples of what unified action among electrical dealers might accomplish. By such an arrangement the central idea is "electrical" gifts instead of any particular firm's name, which would necessarily be the case with individual announcements.

The fact of the matter seems to be that, until the electrical industry becomes more firmly established in the minds of the average citizen as an economical essential rather than an expensive luxury, we should all concentrate our efforts in educating the public to **think electrically.** This will require quite a good deal of newspaper space and no little shouting—but if we go out and shout one at a time there is much less likelihood of being heard above the noise of our competition in other lines of trade than if we all shout together and make a real noise. This may not be necessary in an established industry, but, as yet, it is very necessary in the electrical retail business. In the older industries it must be remembered that this work of education has been going on for a long time, but even now is being continued by the larger interests in the trade who have accumulated the necessary funds to act independently; the little fellows, of course,

Reproduction of full page advertisement.

profit at the big fellows' expense. But in the electrical retail industry the big fellows either have not yet come into existence or they have failed to accept their responsibilities of advertising for the whole trade and so it falls on the rank and file. Since these are not strong enough individually to make the big noise, it follows that they must act collectively, and this just brings us back to what the Brantford dealers have been doing for some time. There are only six of them and even if every one were, individually, to put his little advertisement in the paper, the chances are they would attract a very secondary attention. United in full page spread, however, they were sufficiently in the limelight to make electricity and electrical devices the centre of considerable attention and inquiry during the recent Christmas trade.

Toronto Electrical Contractors' Dinner—Jan. 10

The first meeting of the new year of the Toronto Electrical Contractors' Association, will be held at the usual place—Carls-Rite Hotel—on Thursday evening, January 10th. By the advance sale of tickets it is assured that practically every member will be in attendance at the dinner.

The members are going to run this meeting. If you have discovered a more convenient or a better method of doing certain work you will have your chance to tell it at the meeting. If you have ever struck a snag, electrically, bring along your problem. There will be a blackboard handy. If you have no new ideas, come along and get some.

The G & W Electric Specialty Company of Chicago have recently issued a quick reference list of their potheads and boxes. This list is a supplement of their catalogue No. 9, and will be found of great use to engineers and others in making up of specifications, etc. The list may be obtained from the following G & W representatives:—Bentz-Richardson Co., Ltd., Winnipeg; General Supplies, Ltd., Calgary and Edmonton; A. H. Winter Joyner, Ltd., Toronto and Montreal.

Some Observations on Lighting Conditions

By Geo. G. Cousins*

From the very beginning of the history of the human race man has endeavored, by the most suitable means at his command, to lengthen his period of daily activity beyond the limits of daylight. This after-daylight activity may take the form of work or recreation. Whatever form it takes is dependent upon artificial light, which is, by the very nature of it, man's creation, and is produced and used in various ways, governed by the ideas, knowledge, and requirements of different individuals. Never before has there been such an unlimited variety of appliances for facilitating the application of artificial light, and never before has there been such extensive use of or economical production of it.

Keeping pace with this advancement is the appalling increase of defective vision. Just how much the use of artificial light has to do with defective vision is not easily stated, but it cannot be denied that it is one of its principal causes. Of late years much has been learned of the relation of light to vision, and artificial light and its effects have been very thoroughly analyzed, and considerable publicity has been given to such analysis; and yet, in spite of this, there continues the harmful use of light such as may be seen on every hand.

The first requirement of artificial lighting is utilitarian in its nature, but the esthetic enters very largely into many classes of service, and in many cases is given undue weight, to the detriment of the former. Bad lighting conditions are looked upon by many as necessary evils; by many others all artificial lighting is considered more or less bad and harmful. A comparatively few realize that it can, when properly applied, be as comfortable and unharmful as daylight, and is much more flexible than the latter.

An observing person with any knowledge of the rudiments of illumination cannot fail to notice many of the faulty lighting installations that are altogether too common in our stores, factories, and public places of all descriptions. The good may also be noticed if we look for it; however, the bad is fairly thrust upon our attention by reason of the annoyance and physical discomfort caused by usually present glare or by the inability to see properly. The requirements of good illumination may be briefly stated as follows: That the proper amount of light of the proper quality be properly distributed. It is because of the last of these three factors that so many installations fall from the possible good to the actual bad. It is true that in some installations insufficient light is provided, but in the great majority of cases if the light generated by lamps was properly directed the resulting illumination would be fully adequate for good seeing.

Glare is the eyes' worst enemy. It has been spoken of as light out of place. When glare is present a higher average of useful intensity of illumination for possibly good vision is required than is needed when glare is absent or is so slight as to be unannoying. Glare is the worst offender in the illumination of public places.

A large proportion of those who cater to the public or endeavor to win patronage have a more or less hazy idea that light has some value in attracting people and consequently trade. The old slogan, "The crowd follows the light," does not necessarily mean that the crowd follows high-powered lamps. Many ridiculous installations of high-power lamps are the result of the misinterpretation of this slogan. If merchants would realize that it is not light, but the intelligent application of it, that attracts people, there would be a big change in the appearance of a great many store fronts and show-windows. Light has an enormous advertising value when properly applied so that the light-source itself is unobtrusive, if not invisible, and the outstanding feature of an installation is that which is being illuminated and not that which does the illuminating. A store front or show-window may be likened, to some extent at least, to the introduction to a composition of music. It makes a demand on our attention, and our impression of what follows is largely influenced by the first impressions made on us by the introduction. For this reason it is important that store fronts should be made attractive, and in order to make the most of window displays artificial light must be resorted to. The application of artificial light will make or mar the effectiveness of any display of merchandise according to the skill and knowledge entering into the solution of the problem.

A common example of the misapplication of light is shown by the following case: A well-kept, bright store is equipped so that the lamps installed to illuminate the show-window also furnish much of the illumination of the store. Above the plate glass window is a valence of diffusing glass, and behind this, placed close to the ceiling, are three 100-watt lamps, equipped with prismatic reflectors. This was the original installation, and showed that common sense had been used in planning it. However, in the centre of the window, at about the level of adults' eyes, is a gas-filled lamp (about 200 watt), equipped with a shallow mirrored reflector, so that the lamp filament is below the rim of the reflector. It is plain that this lamp was installed without the assistance of common sense. Whether one is on the inside or outside of that window, "safety first" demands that the eyes be turned away from this objectionable lamp. From across the street the window full of goods looks like an intensely bright lamp in the centre of a large frame. The resulting glare quenches any desire to examine the goods on display. If this application of light has any value it is a negative one, and defeats its own purpose. Several other installations of the same lamp and reflector, installed in the same way, were noticed in the same block, and it is at once clear that the neighborhood has been the victim of an energetic but ignorant salesman. This condition is not an isolated one, and is far too common even on some of our best business streets. In all probability, the time will soon come when such a condition will be prohibited by legislation. In the same class as this is the placing of arc and other high-power lamps in doorways and over the outside of show windows. It is inconceivable that business men, otherwise intelligent and quick to appreciate common sense, should permit themselves to inflict such outrages on the eyes of the public.

Indirect Lighting Could Be Used

Another class of offenders are the barbers who require their patrons, while being shaved, to gaze directly into a lamp equipped with a powerful reflector, located over the chair. The same reflectors turned upside down would eliminate the glare and still provide good illumination, provided that the ceiling received a little attention and white paint. The shadowless effect of indirect or semi-indirect lighting is a decided advantage for this class of service. It benefits both the shaver and the shaved.

In a certain city of fairly large size is a hall where many concerts and recitals are held. The interior is very attractively decorated, and is indeed a very pleasant place to enjoy a concert or recital, except for one serious fault. Sitting in the balcony and looking toward the stage one sees a bright lamp at each side of the stage, and just above the line of

* Hydro Laboratories, Strachan Ave., Toronto.

vision is the large central fixture, supporting translucent reflectors. A worse case of glare could hardly be imagined. It is a fairly safe guess that the architect or the man who planned the lighting never occupied a balcony seat during a performance. Patrons have found it necessary to shade their eyes with their programs or anything else at hand during performances. This condition could very easily be remedied by simply shortening the fixture suspending chains. From the main floor the central fixture is not objectionable, but the bracket lamps at the sides of the stage cause some annoyance. It is regrettable that such conditions exist in the face of such obvious remedy.

It is a very common practice to place lamps in brackets at the sides of concert platforms and church pulpits to light speakers, singers, or anybody who may be using the platform. It is rarely that such lamps are effectively shielded from the eyes of the persons in the auditorium, and the result is that glare is produced that tends to cause drowsiness, besides impairing the vision. In many cases the architectural features permit the use of concealed lamps to illuminate persons using the platform. If side lamps are desired for the sake of appearance, they should be of low power and well shaded by dense shades or globes.

The need for co-operation between architect and engineer is very much in evidence in churches. A typical example is that of a comparatively new edifice equipped with a row of fixtures along the centre, each supporting five bell-shaped translucent reflectors; brackets supporting two reflectors each are placed along the side walls. Members of the congregation complain of the lamps over the pulpit affecting their eyes, and members of the choir have to face a row of lamps just below the lower edge of the balcony. These defects may also be remedied by raising the fixtures in question, and, in this case, with no loss of useful light. In the ceiling of this church, on each side of the gable, is a row of large panels of light-colored glass. These would have provided an excellent opportunity to furnish a beautiful, soft-tinted light for use during the evening sermon and to supplement the main lighting during the opening and closing exercises by placing lamps with suitable reflectors in the peaks above the panels. The cost of such provision during construction of the building would have been very slight, but since the completion would, of necessity, be very much increased.

Intelligent Distribution Necessary

In lighting churches a common fault seems to be to equip the lamps with enclosing globes, usually decorative, in keeping with the scheme of architecture, but which do not appreciably improve the natural distribution of light from the lamps. Too much light is thus wasted on the walls, and the fixtures are hung low, so as to produce a sufficiently high intensity where it is needed, and, of course, the low height of such units causes glare.

Sometimes fixtures of good design and pleasing appearance are carelessly installed, with the result that the general appearance of the installation is considerably marred. Such is the case in a church equipped with semi-indirect bowls, adjusted so that the cut-off shadows on the walls form very uneven lines, because the lamps were not adjusted to a uniform position relative to the bowls. This is the only bad feature of an otherwise pleasing installation, and if the electrical contractor had any pride in his work, would soon see to it that it be eliminated.

The lighting of churches is not always a simple problem. The presence of balconies requires that the central fixtures be hung high, so as to keep the light sources out of the line of vision of occupants of the balconies. Beneath the balconies fixtures must be placed where head-room is usually very limited, and considerable skill is required in the selection and placing of units to avoid glare.

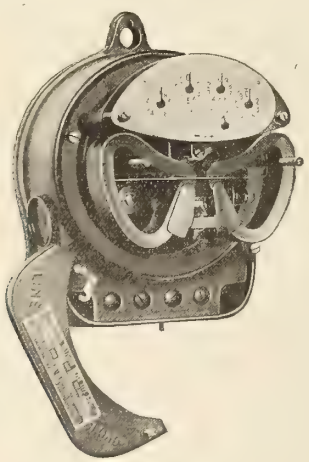
During the summer months the many feeble attempts to light bowling greens by a row of bare lamps suspended high enough to clear the heads of the men are good examples of illumination at its worst. All that can be said of bad illumination applies to installations of this class. Some of the money spent for energy and lamps invested in reflectors would make an enormous difference, and bowling under the improved conditions would be much more enjoyable.

The lighting of schools presents some interesting problems. Desks require illumination very similar to that of offices, but blackboards require very different treatment. It is often a rather difficult problem to illuminate blackboards properly so that chalk marks can be easily read from any part of the room. Fixtures used for the general room lighting are very often placed so that light from them is reflected specularly by the blackboard. In a certain modern educational institution this condition is very much in evidence in some of the rooms. Pupils are sometimes required to move from one seat to another to see work that is being done on a blackboard at the other side of the room from where he first sat. Such a condition is very likely to result in eye-strain, and every possible means should be resorted to to eliminate it.

Conditions in Industrial Plants

The foregoing cases are defects due principally to faulty design. There are other cases where illumination deteriorates through neglect. For instance, a hotel verandah is illuminated by lamps in prismatic stalactites which are nearly half-full of dead insects. This condition, aside from its bad appearance, reduces the resulting illumination very considerably. Examples of neglect are not by any means confined to artificial illumination. In large industrial plants where the work is mostly rough, the windows are usually sadly neglected, and it is often easy to count the number of windows that have been broken since the original installation. The worst that has ever come to the writer's notice is the machine shop of a cement plant. Here lamps were kept burning on bright, clear days, and were needed, too. It is no trouble to pick out otherwise well-kept factories whose windows absorb as much as 50 per cent. of the light, and yet superintendents would be insulted if told of this condition. There is probably no other factor that contributes so much to the quantity and quality of the factory output or to the welfare of the workers or that can be obtained at so little cost as daylight, and yet, until very recent times, has been sadly neglected. Modern factories are being put up that have plenty of window space, but if the windows are not kept reasonably clean there is a serious decrease in daylight illumination.

In this article attention is drawn chiefly to faulty conditions of illumination, the good being practically unmentioned. It is not the purpose, however, to exaggerate the former and minimize the latter. The examples cited are in actual existence, and are typical of the various classes of installations. The point to be emphasized is that such conditions are being duplicated over and over again. It is strange that electrical contractors or architects who plan the lighting of buildings are so unobserving or careless of their work that they do not return to remedy so many of the defects that may be so easily remedied.

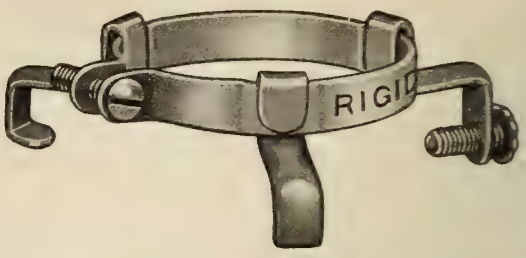


The Ontario Safety League have just distributed their third annual report for the year ending December 31, 1916. It shows that, during the year, the following distributions were made:—25,000 letters to drivers of vehicles; 83,000 school bulletins; 100,000 letters to parents; 62,000 industrial bulletins; 155,000 gummed seals; 4,000 sundry cards and bulletins; 5,000 cards to motorists; 2,000 traffic reports; $50 in essay prizes.

"Golden Glow" and "Crystal Mirror" Projectors

As a further development of their line of "Golden Glow" and "Crystal Mirror" flood-lighting projectors the Electric Service Supplies Company has placed on the market a new flood-lighting unit to be known as type FL-1419. This new type of projector is particularly designed for short range work where a wide beam dispersion is desired. They are equipped with 14-inch long focus type parabolic "Golden Glow" or "Crystal Mirror" reflectors, which project, respectively, powerful dispersed beams of rich golden light and white brilliant light. This company in their recent new catalog on flood-lighting projectors classified the different flood-lighting subjects in two divisions, namely, those in which the human eye is brought into continuous use to observe detail and those in which the human eye figures only momentarily or where lighting the subject as a whole is the main consideration. In the first classification they strongly recommend "Golden Glow" light, and in the latter case the white, brilliant light from "Crystal Mirror" projectors is desirable. This new type meets a demand for a more powerful projector than any heretofore cataloged by this company, it being adapted to use with 500 to 1500 watt type C Mazda (or nitrogen filled) lamps.

Watthour Meters



How often is it desirable to tear down and re-assemble a watthour meter? In answering this question it is difficult to make a definite statement as to the number of years a meter will operate accurately under the various conditions to which watthour meters are subjected. The average general practice in Canada, however, is to clean meters at least once in five years. In order to make the cleansing thorough, it is considered advisable to disassemble the meter frequently, clean and rebuild it. Then again, there are many conditions such as abnormal voltage due to surges, etc., also fires which damage meters to such an extent that it is necessary that they be overhauled. As this cleaning and overhauling is

desirable and necessary to maintain the meter's accuracy, its cost is an important factor in the operation of a meter department. Having this in mind, the Canadian General Electric Company's latest type of watthour meters have been designed having in mind their simplicity and accessibility. There is no particular order of operation to follow, to disassemble completely these meters, since the electrical damping and moving elements can all be removed independently of one another. Meters having such features can be torn down, cleaned and reassembled quickly and at low cost. These meters are also arranged with micrometer adjustments for full and light load and a ready means for inductive load compensation, which increases the speed with which they can be recalibrated after they are reassembled.

Duncan New "Rigid" Shadeholders

The Duncan Electrical Company, Limited, of Montreal, are now manufacturing a 2¼ in. "Rigid" Shadeholder for brass and porcelain sockets, which is of interest to the trade,

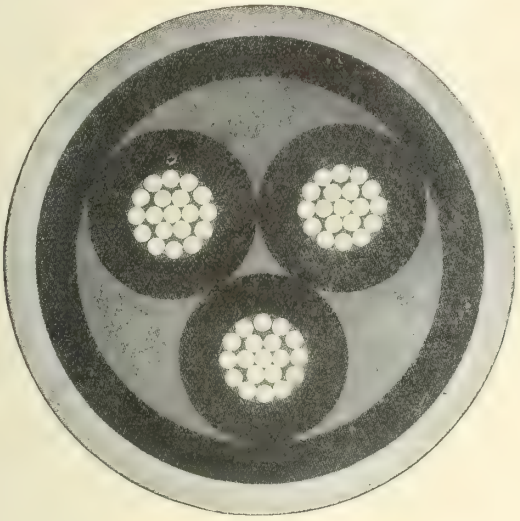
due to the fact that only one thumbscrew is needed to adjust holder on shade, as shown in accompanying illustration. This holder is made of very heavy brass, and when attached to socket is more "rigid" than any other holder on the market.

Trade Publications

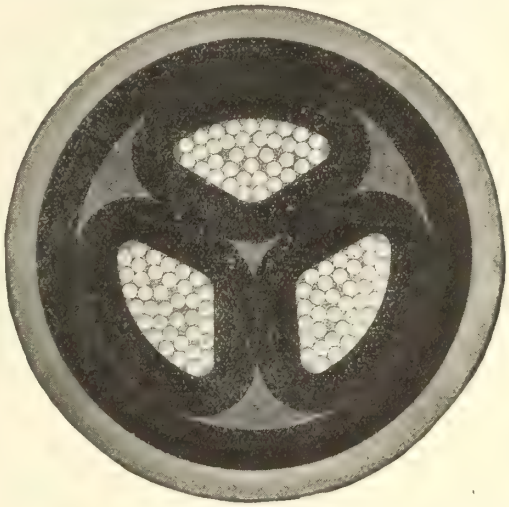
C. G. E. Publications—Bulletin No. 46021, Curve-Drawing Ammeters and Voltmeters, Types CR and CR-2; Bulletin 68305-A, Safety-First Knife Switches; Bulletin 61401, Varying Speed Brush Shifting Motors; Bulletin 46013, Portable Instruments (Alternating and Direct Current); Bulletin 47469, Type FK-24, Oil Circuit Breakers.

Centrifugal Pumps—The Canadian Allis-Chalmers Limited, are distributing Catalog 1632-B, entitled "Centrifugal Pumps and Centrifugal Pumping Units." This is a valuable booklet of 50 pages, calling attention to the centrifugal pump for all classes of pumping service. It is well illustrated and contains many tables and curve charts.

Safety Panels and Cabinets—Bulletin No. 10, by the Crouse-Hinds Company of Canada, effective December 1, 1917, being supplement to Panel and Cabinet Bulletin No. 1, describing two types—the DPS, arranged for Edison fuse plugs in the branches, and the EPS arranged for N.E.C. cartridge fuses. This company are also distributing a folder, "Condulet Suggestion 35," concerning "Condulets" as applied to steamboat equipment.



The Chatham, Wallaceburg and Lake Erie Railway system was forced to suspend their service recently on account of the shortage of gas, which they use to generate electric power.



The Onward Manufacturing Company, Kitchener, Ont., have opened a branch office at 10 St. Antoine Street, Montreal. The new office will be in charge of Mr. O. W. Miessener, manufacturers' agent.

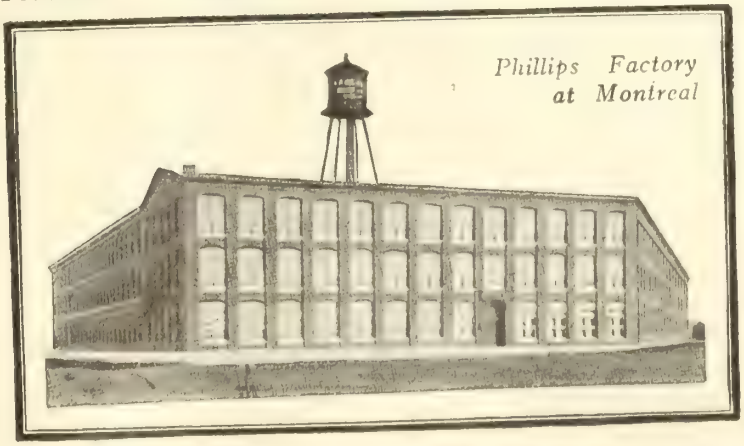
It is announced by the War Industries Board of the United States that formal assurances have been given Canadian authorities that the hydro-electric power at present being imported into the United States from Canada will not be used for any purpose other than the manufacture of war materials. In view of the shortage of power in the province of Ontario, which has handicapped some of our munition plants, it has been felt that the Canadian power at present being exported to the United States should be withheld in accordance with the agreement under which this power was originally allowed to go out of the country, namely: that it should be subject to recall on demand. In view of the fact that the extra power is wanted on both sides of the line for the same purpose, the Canadian Government is making every possible effort to meet the local demand without interfering with the munition industries across the line and it is on account of this that assurances have been given that Canadian power shall not be used for any purpose except to turn out war supplies.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Phillips Factory at Montreal

Current News and Notes

Brantford, Ont.

The Electric Smelting Company, Brantford, Ont., have been granted a charter.

Chatham, Ont.

The annual report of the Chatham Hydro-electric System gives the number of consumers as 1,558—an increase of 252 over last year. The total revenue is $45,714, as compared with $28,544 last year.

Galt, Ont.

A bylaw has been passed in Galt, Ont., to raise $45,000 to pay for extensions to the city's hydro-electric system.

Hamilton, Ont.

The Barton Township Council will submit a bylaw to the electors authorizing an expenditure of $55,000 for the purpose of installing Hydro power throughout the township.

Two new transformers have been installed at Hamilton, Ont., which, it is anticipated, will entirely overcome the eccentric service experienced in that city during the recent past.

Ingersoll, Ont.

Considerable improvements are being made to the power plant of the Ingersoll Telephone Company, Ingersoll, Ont. New storage batteries are being installed as well as a mercury arc rectifier.

Kingston, Ont.

The 44,000 volt line from Napanee to Kingston, which will serve Kingston, has been completed.

Merrickville, Ont.

The Rideau Power Company, of Merrickville, has requested the Hydro-electric Power Commission to design and purchase the necessary high tension equipment for its power house, in order to supply power to the Commission.

Orillia, Ont.

The annual financial statement of the Orillia Water, Light and Power Commission for the year ending December 10th, 1917, shows that notwithstanding the decrease in rates which affected last year, the receipts from lighting increased $1,844. The ordinary power receipts show a decrease of $6,915, but this leaves out of account $68,622 received from the munitions factories, which goes to pay for the power purchased from the Hydro-electric Commission. So far the Commission has been paid $46,153. Under the arrangements any surplus remaining after the account is finally closed is to be returned to the factories interested. About $15,000 has already been returned and there is still about $10,000 in this account, which constitutes the greater part of the "accounts payable."

Parkhill, Ont.

The residents of Parkhill, Ont., recently carried, by a large majority, a by-law authorizing an expenditure of $12,000 for the installation of Hydro power.

Perth, Ont.

The municipality of Perth recently passed enabling and money by-laws by substantial majorities. It is proposed to raise $120,000 by municipal debentures and to purchase the local electric and waterworks plant from the present owners, the Canadian Electric and Water Power Company. The Commission propose building a 26,400-volt transmission line between Perth and Smith's Falls, in order to supply the town with power. It is proposed to change over the present generating stations and distributing systems from 133 cycles to 60-cycle equipment.

Picton, Ont.

The town of Picton recently passed a Hydro enabling by-law. The present lighting plant is steam-operated and is the property of the muncipality. It is proposed to close down the steam plant and change the distributing system over from two-phase to three-phase. The municipality also propose to instal a motor-operated centrifugal waterworks pump of 1,000 gal. per min. capacity.

Regina, Sask.

A bill designed to authorize the use of one-man cars in Saskatchewan was "killed" by the Legislature of that province.

Toronto, Ont.

To save power for manufacturing purposes the Toronto city council have authorized the cutting off of 273 lights until the month of April. Each light cut off represents a saving of $9.20 per annum.

The Ontario Hydro Commission is purchasing two 4,000 kv.a. synchronous motors to be installed at Toronto for power factor correction on the Niagara system.

Trenton, Ont.

The Ontario Hydro Commission propose to serve the towns of Picton, Wellington and Bloomfield, in Prince Edward County, by means of a 44,000 volt line from Trenton. A sub-station will be erected at Wellington, for serving Wellington and Bloomfield, and a 4,000 volt line will be built from Wellington to Bloomfield. A sub-station will also be erected at Picton to serve this town.

Vancouver, B.C.

The British Columbia Telephone Company, Vancouver, B.C., will commence shortly the laying of another submarine telephone cable across False Creek.

Amendments to city by-laws adopted by the Vancouver city council recently provide that jitney competition against the B. C. E. R. Company will be prohibited after April 1, 1918.

Whitby, Ont.

Construction work has begun in Whitby, Ont., on a track from the Grand Trunk main line station to the military hospital on the lake-front. This road will be the initial unit of Whitby's street railway system authorized by vote of the municipality in adopting the Hydro radial proposal from Toronto to Whitby.

Windsor, Ont.

Two new electrically-driven pumps are to be installed in connection with the Windsor water supply system. It is proposed to use Hydro power to drive the pumps and keep the present steam installation for auxiliary purposes. In order to relieve the load on the Hydro system in the evening hours, however, the steam pumps will be used for an hour or two.

Wellington, Ont.

The town of Wellington, Ont., has passed enabling and money by-laws, 202 for and 1 against. It is proposed to issue debentures for the sum of $10,000 for the purpose of buying out the existing system and remodelling it. The Niles estate, owners of the existing system, has agreed to sell to the town for the sum of $3,000.

If You Build Motor Driven Machines

Wagner, Quality

The motor should not be less in quality than the machine. And it should be exactly suited in characteristics and horse-power to give the machine the best possible performance.

You can get the **Wagner, Quality Motors** that will meet all these requirements. The experience of the Wagner Company in this direction, whether for very large or very small machines, will be valuable to you. The reputation of the **Wagner, Quality Motors** will help to sell and keep sold, your products.

Send for Bulletins 11013 and 11113.

Salaries by Mail Encourage Thrift

After trying various experiments the Detroit Edison Company has adopted the plan of sending employees' weekly checks by mail to their homes, and is pltased with the result.

The pay-roll week ends on Wednesday night, and the pay checks are put in the mail on Saturday, so that they are delivered in the first mail on Monday morning.

Before the change was made it was necessary to use six or seven automobiles every pay day in order to reach the men. This was inconvenient as well as risky.

There are 3,500 employees scattered over a large area, and in some instances 40 miles from Detroit, and the difficulty of paying them promptly and easily by any other method than through the mail by check is obvious.

NOTICE

Pursuant to Power Commission Act, 6 Geo. V, Chapter 19, Section 39, 1916, and amendments thereto, and the Rules and Regulations of the Hydro-Electric Power Commission covering the design and construction of electrical machinery, apparatus, appliances, devices, material and equipment for use in the generation, transmission, distribution or use of electric power or energy in the Province of Ontario, in connection with any electrical installation or wiring for electric light, heat or power, where the electric pressure delivered to or from the same exceeds 10 volts, manufacturers of, jobbers, agents and dealers in electrical machinery, apparatus, appliances, devices, material and equipment, and others interested are hereby notified that the Commission orders that on and after three months from date of this notice no such electrical machinery, apparatus, appliances, devices, material or equipment used, or to be used, as above, may be used or disposed of in the Province of Ontario unless and until the design and construction of same has been submitted to the Hydro-Electric Power Commission of Ontario, and approval of such has formally been obtained.

By order,

The Hydro-Electric Power Commission of Ontario

W. W. POPE, Secretary

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price $3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price $2.00.

Alternating Currents—Examples for Students and Engineers, by Prof. F. E. Austin. Second edition, Vol. I. Published in 1916. 223 pages, illustrated. Price $2.40.

Applied Electricity for Practical Men, by Arthur J. Rowland. Published in 1916 by McGraw-Hill Book Company. 375 pages, illustrated. Price $2.00.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price $1.00.

Central Station Management, by H. C. Cushing, Jr., and Newton Harrison. Published in 1916 by D. Van Nostrand Company. 397 pages. Price $2.00.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price $3.00.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price $1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price $2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price $2.00.

Electric Cooking, Heating and Cleaning, by Maud Lancaster. Published in 1914 by D. Van Nostrand Company. 330 pages, illustrated. Price $1.50.

"Electrical Machinery"—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price $2.00.

"Electrical Meters," by Cyril M. Jansky, B.S., B.A. Second edition just published by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price $3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electrical Instruments in Theory and Practice, by Murdoch and Oschwald. Published in 1915 by Whittaker & Company, 366 pages, illustrated. Price $2.50.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

'Electrical Measurements in Practice," by F. Malcolm Farmer. First edition. Just published by McGraw-Hill Book Company. 359 pages, illustrated. Price $4.00.

Electrical Measurements, by O. J. Bushnell and A. G. Turnbull. Published in 1914 by American Technical Society. 164 pages, illustrated. Price $1.00.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

"Hydro Electric Power Stations," by Eric A. Lof and David B. Rushmore. First edition. Just published by John Wiley & Sons. 822 pages, illustrated. Price $6.00.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Practical Mathematics for the Engineer and Electrician, by Elmer E. Burns and Joseph G. Branch. Second edition. Published by the Joseph G. Branch Publishing Company in 1914. 143 pages, illustrated. Price $1.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

"Public Utility Rates." A discussion of the Principles and Practice underlying charges for Water, Gas, Electricity, Communication and Transportation Services, by Harry Barker, B.S. First edition, just published by the McGraw-Hill Book Company. 387 pages. Price $4.00.

Pumps and Pumping, by M. Powis Bale. Published in 1912 by Crosby, Lockwood & Son. 120 pages. Price $1.50.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

Radio-Telegraphist's Guide and Log-Book, by W. H. Marchant. Published in 1912 by Whittaker & Company. Illustrated. Price 75 cents.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Railway Maintenance Engineering, by Wm. H. Sellew. Published in 1915, by D. Van Nostrand Co. 360 pages, 194 illustrations and 6 folding plates. Price $2.50.

Standard Wiring, 1917 Edition, 23rd Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.00 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

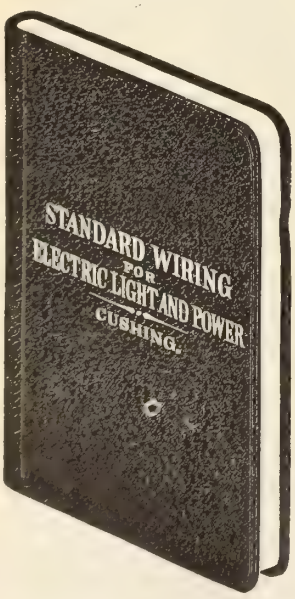
"The National Authority on Wiring and Construction"



—The Electrical Journals of the United States, Canada and England

Over 359,400 Sold

By H. C. Cushing Jr.

Fellow American Institute of Electrical Engineers; formerly Electrical Inspector for Boston Board of Fire Underwriters and Underwriters' Tariff Association of New York.

24th Year **24th Edition**

1918 Standard Wiring

Officially adopted by the National Electric Light Association.

It is the only book on Electric Light and Power Wiring and Construction endorsed and recommended by every Board of Fire Underwriters in the United States and Canada, because it is the only one kept strictly up-to-date and revised every year in accordance with every rule and requirement of the

National Electrical Code

which it contains, explained and illustrated. The 1918 Edition has been completely revised from the first to the last page, and contains new illustrations, tables and diagrams in accordance with the latest and best practice, and a special new section of fifty pages on House Wiring.

"It settles disputes and, if referred to before wiring, prevents disputes."

Sent to any address, postpaid, on receipt of $1.00 Leather Cover Pocket Size

ESTABLISHED 1849
BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que; Ottawa, Ont.; Quebec, Que.; St. John, N.B; Toronto, Ont.; Vancouver, B.C.; Victoria, B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.

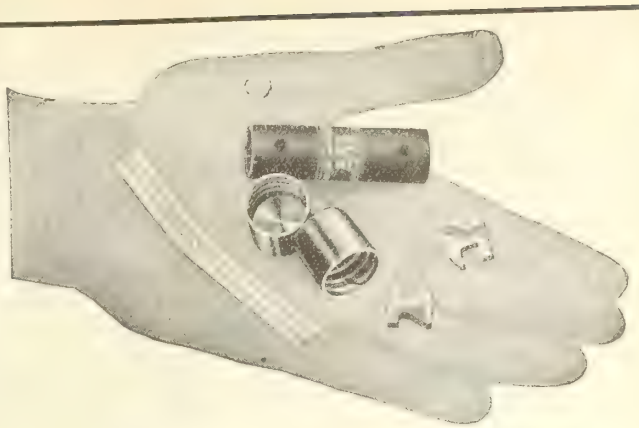
Are you interested in the remarkable development which has been going on in the

I-T-E CIRCUIT BREAKER

during the past year or two?

The scope of our work enables us to supply **practically standard breakers for special service.** We submit that the circuit breaker art of the world is what we have made it. A search of the Patent Office records will prove this statement, or an easier way might be for you to look at any recent notable installation.

Take the Equitable Building in New York, for example, or the Lumber Exchange and the Conway Building of Chicago, or the wonderful equipment of the Ford Motor Company.



The Cutter Company

Los Angeles San Francisco
Portland, Ore.

CIRCUIT I-T-E BREAKERS

TRADE AUM MARK **Renewable Fuses**

FOR ELECTRIC LIGHT AND POWER

Always were the simplest fuses in construction on the market. The new Type "B," Form 4, has been reduced to the fewest parts—four metal parts of solid brass, a fibre shell and the fuse strip. Caps are removed by a twist of the wrist and as easily tightened, holding the fuse strip in intimate metal-to-metal contact.

LINCOLN MOTORS

Your Customers Know Them

The man you have to deal with in any industrial plant will know Lincoln Motors.

The managers and superintendents of these plants have read about Lincoln Motors in their own trade and technical papers. They know the waterproof, dust-proof insulation—the simplicity of construction — the overload capacity and the other features that make Lincoln Motor drive a paying investment.

The Lincoln advertising campaign is boosting for more motor-driven plants —and more Lincoln Motors.

Speak to your customers about Lincoln Motors.

Write for Bulletin on Motors.

Westinghouse

Automatic Electric Ranges

The Westinghouse "Automatic Electric" is a full sized range large enough for any family, yet economical even when cooking for two. It revolutionizes cooking.

The time clock turns on the current at any hour set. The automatic thermometer turns it off when the ovens reach the desired temperature. Then the ovens use no more electricity, but continue to cook the meal with the stored up heat, like a fireless cooker.

The ovens are made to hold the heat, keeping it in the stove, instead of radiating it in the kitchen, or throughout the house.

Every part of the range can be kept sweet and clean. Everything can be instantly removed from the ovens, and the ovens, which are lined with rust-resisting metal, thoroughly scoured and dried. There are no inaccessible places for dirt or crumbs to collect.

Type 3-19B Full-Automatic Electric Range.

Type 2-19B Semi-Automatic Electric Range.

We also manufacture non-automatic electric ranges, and semi-automatic ranges in which the current is turned on by hand and an automatic thermometer rings a bell when the desired temperature is reached, as a reminder to turn the current off by hand.

There is not a more economical electric range than the Westinghouse, or one that is more convenient, substantial and durable.

Our nearest office will give further particulars.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a **Specialist in Repairs.** Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind **now.** Say **"I'm going to get something out of the next repair job in this town."**

You have the work of taking out and re-installing the machine **(Profit).** Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the **Trade Discount (More Profit).**

Others are doing it. Why not you? Write about it.

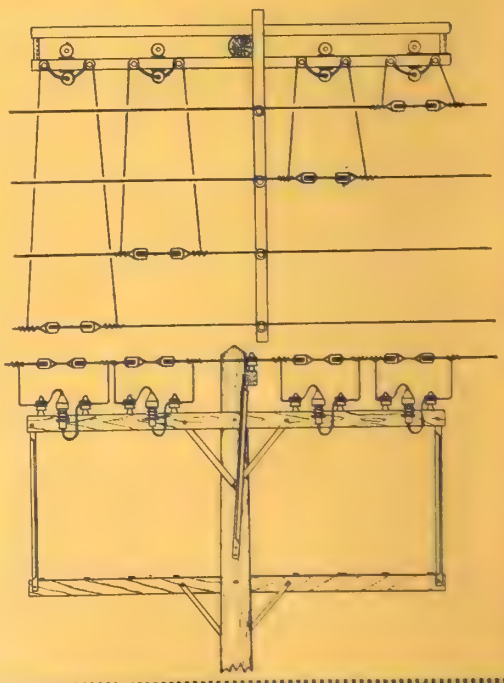
G & W DETACHABLE POTHEADS

On Overhead Lines

Make Your Service Flexible



Every distribution system, large or small, needs a simple provision for sectionalizing and testing. Cutting wires entails expensive repairs and loss of revenue.

G & W Detachable Potheads enable you to test out the line, to localize a case of trouble, and to correct it in the shortest possible time.

In case of feeder trouble, Potheads may be used to connect the load to another feeder. The possibilities for manipulation of circuits are numerous. The simplicity and low cost of the G & W Pothead make it available where there is or may ever be an occasion for disconnecting. Its absolute reliability, ample carrying capacity and safe construction make it equal, in point of actual results, to any device that could be installed.

The Best Known Cable Reel in Canada

In Halifax or Vancouver, whether on the public thoroughfares of our larger cities or smaller towns, wherever there is a cable installation in progress, the reels invariably bear the name of the Northern Electric Company, Limited.

The installation may be overhead, underground or submarine. It may be for a Telephone Company, a Telegraph Company, a Railroad Company, or for a street lighting system.

The quality, both of the product and the service, is largely the reason for the universal demand for Wires and Cables of Northern Electric manufacture.

C-H Seventy Fifty SWITCH

A Feed-Through Switch That Sells on Sight

because it just naturally belongs with almost any portable electrical appliance. Just to mention that you can attach the Seventy-Fifty to the cord any place it's wanted—so it's right under the operator's thumb—means no reaching to overhead sockets, no walking across the room to push a button—how it saves current because it's so handy it can't be overlooked—and it at once appeals to you.

The C-H Seventy Fifty SWITCH

Can be used with any make of Electrical Appliance within its capacity of 750 watts—

—3 amperes, 250 volts; 6 amperes, 125 volts. Enclosing case is made of nicely-finished Thermoplax insulating material. The attractiveness and utility of the Seventy-Fifty means a steady demand.

LINCOLN MOTORS

Simplicity
Lincoln Arc Welder

The Lincoln Arc Welder is a simple machine which any one can understand and operate.

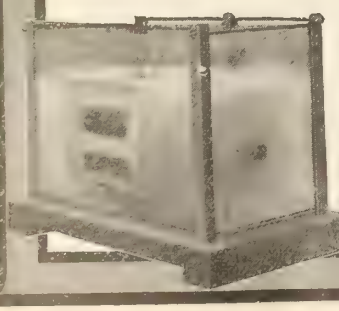
The motor is a standard Lincoln Machine, designed to operate on the kind of electric current you use.

It is direct connected to a generator which delivers electric current at the proper voltage for welding.

The control panel mounts the two necessary meters, a small hand wheel for regulating current and the simple knife switch connections.

The stabilizer is an electric magnet which gives stability to the current and makes the arc easier to control.

Insist on simplicity when you buy a welder.



Ask for Welding Bulletin.

New Type Polyphase Meters

Specially Constructed

To start with one clearly-defined purpose—to pursue that purpose with a strong determination to excel, backed by experience, has been the effort of the Chamberlain & Hookham Meter Company.

Now, however, their ultimate success has been proved in this new type of Poly-Phase Meter. The basic principle of this exceptional quality may be attributed to the fact that they are constructed with a double terminal block, which ensures greater protection in overloads. Also, the insides of these meters are designed with plenty of room for connections—a safety feature in lightning storms and surge conditions. Moreover, all three wires are carried direct through the meter, from left to right.

These Poly-Phase Meters are used on the lines of the Hydro-Electric Power Commission of Ontario. Does not this prove recognized ability?

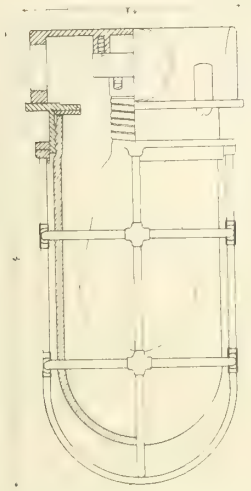
THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.



Bulletin No. 530 describes this instrument.

THE NATIONAL AUTHORITY FOR TWENTY-FOUR YEARS

THE 1918 EDITION

POCKET SIZE
LEATHER COVER

"STANDARD WIRING"

TELLS YOU HOW

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or for A. C. single, two or three-phase.

OUTSIDE WIRING—Pole line construction, line wires, service wires, roof structures, poles and their dimensions and weights, and how to erect and protect them and wires they carry. Insulators, guard arms, guy anchors. Tree wiring, splicing, service and entrance wiring. How to install Lightning arresters. Transformers with diagrams and instructions.

INSIDE WIRING—When and where to use rubber covered, slow burning and weatherproof wire. How to find the proper size of wire to use for lamps, motors or heating devices for any current, voltage and drop, either by formula or by the many tables that are given in this section of the book. How to wire for two-wire or three-wire systems. Direct current, two-phase and three-phase with formulae and tables, with examples worked out for each system and in a simple manner that anyone can understand and use. How to run wires on walls, ceilings, floors, through partitions and walls and in concealed places, damp places and where dangerous surroundings exist. When and where to install Switches, Cut-outs and Circuit Breakers and just how to do it. How to wire for high and low voltage systems and the precautions to be taken. The proper way to install Knife and Snap Switches, Cabinets and Cut-out Boxes. Outlet, Junction and Switch Boxes, Panel Boards, Wooden and Metal Raceways. How to install complete interior conduit jobs either for rigid metal, flexible metal or flexible non-metallic conduit. Concealed knob and tube work or armored cable. How and where to install and wire electric and combination lighting fixtures. How and where to use flexible cord and where not to use it. How to install arc lamps and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and gas filled lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination and where each should be used. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

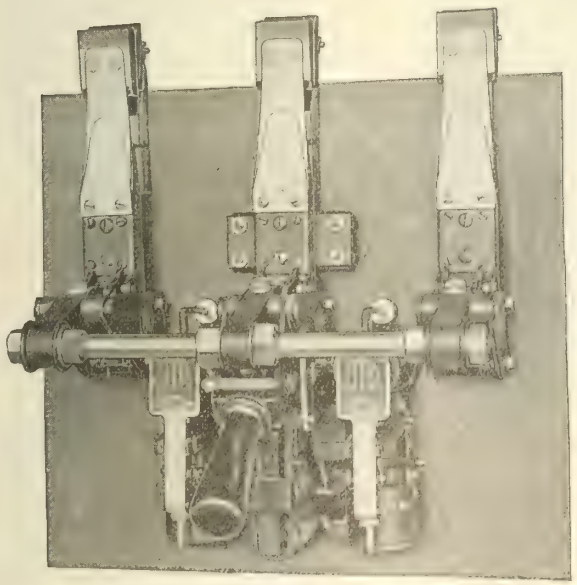
Cooling Condensing Water

by the

"SPRACO" Method

Exterior view of cooling pond—United Last Co., Montreal

For the rapid and inexpensive cooling of water for condensors, water jackets, transformers and steam turbines, the Spray method is the most satisfactory. It is the scientific application of the simple idea of spraying water into the open air—this cools it and the water s collected in the cool pond and used over again.



"Spraco" equipment also includes air washers for supplying cool, clean air for high capacity generators.

Our engineering staff is at your service. Literature sent on request.

Robbins & Myers Fans

THE beautiful finish and graceful design of The Robbins & Myers Fan are a big sales help for the dealer. They attract the customer's attention immediately and carry a strong suggestion of the quality built into the Fan.

The graceful outlines, the smooth, even surface of the drawn steel frame and base, the highly polished brass blades, the neatly constructed guard, the felt base, the smooth, gloss-black, baked enamel finish and the neat gilt stripes are all features of the R & M Fan which make a strong appeal to the buyer and result in easy sales for the dealer. Quality is reflected in the appearance of every detail.

And in every respect—performance, durability and efficiency—the R & M Fan measures up to its appearance. When you sell a Robbins & Myers Fan you know your customer will be just as highly pleased with the service it will give as he is with the appearance. He is insured many years, probably a lifetime of reliable fan service.

Appearance, performance and reputation all contribute to easy, profitable sales when you sell Robbins & Myers Fans.

Fig. 1

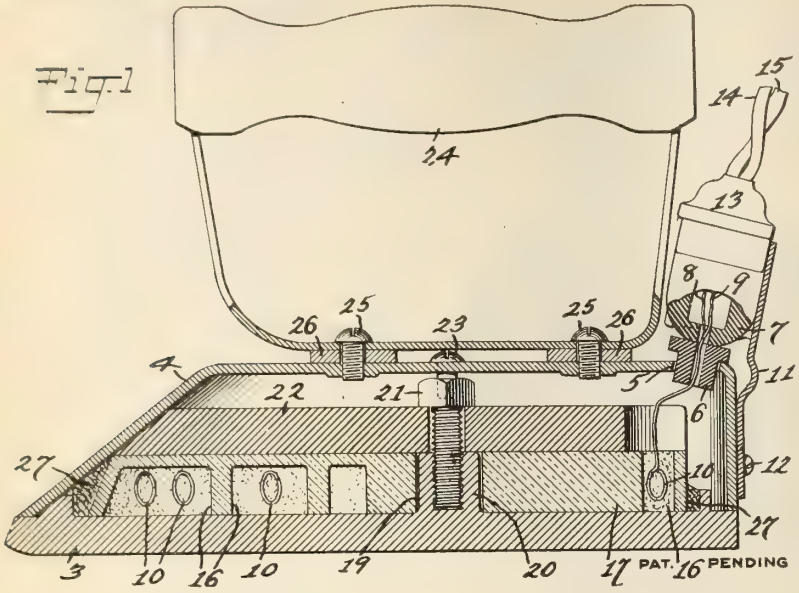

Fig. 2.

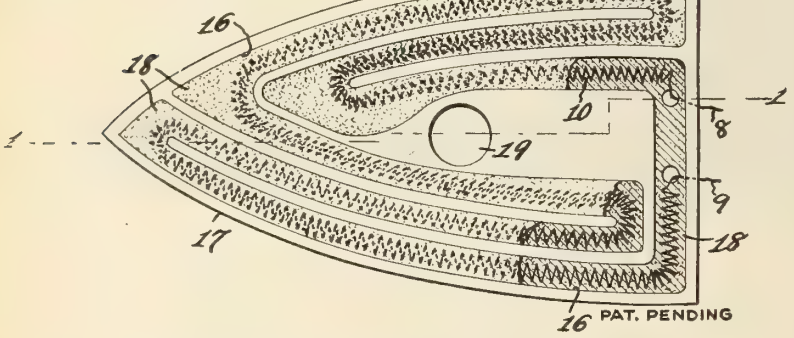

Fig. 1 is a section of the iron, showing clearly the method of assembly. The metal case (3) is highly polished and plated on under surface, having a rabbet at the upper outer edge for the reception of the cover (4), having a central opening (5) in the rear end for the porcelain bushing (6) connecting with plug base (7) containing terminal binding screws and posts for the ends (8) and (9) of the resistance wire (10), and which ends pass upward through bushing (6). The plug base (7) is held to the cover (4) by means of a plate (11) detachably secured to this cover by screws (12), and the plug base (7) is adapted to receive the plug (13) of the lead wires (14) and (15), which are attached to lamp socket, or other electric fixture. The resistance wire (10), coiled, is laid in channel (16) of porcelain plate (17) and channel (16) is filled with cement (18), which protects and preserves the element (10). This cement can be easily dug out in case access is desired to the wire (10). The porcelain plate (17) is provided with a hole (19) for the passage of a boss (20) cast integral with base (3) and the height of which exceeds the vertical thickness of the porcelain insulator (17). Held on top of boss (20) by a screw (21), is weight plate (22) and the cover (4) is held in place by means of a screw (23) threaded into cap screw (21). Note that this method of assembling is very simple and substantial. By having the boss (20) extend above porcelain plate (17), the weight plate (22) does not touch or bind on the porcelain insulator (17), we thereby eliminate the possibility of breaking the insulator (17) by the expansion of metal bodies (22) and (3), when heated.

The Seventh Anniversary of the Canadian Queen Electric Iron and Toaster

Seven years ago this month the first Canadian Queen Electric Iron and Toaster was built and they are still in use. Some dealers remark "they last too long, a customer will never need a new one."

The Canadian Queen line is designed with that result in view, as you will note by the cut and description.

We now have our new factory finished, which enables us to double our production so that prompt shipment is guaranteed.

In the "New Canadian Queen" electric iron the heating element wire is placed in a heat resisting porcelain plate, as shown in Fig. 2. The channel is then filled in with a special cement, composed of materials that tend to preserve the element from oxidation; this being accomplished, the element should last indefinitely.

If your jobber cannot supply you, let us hear from you direct. Ask for folder "K."

ADVERTISEMENTS

Orders for advertising should reach the office of publication not later than the 5th and 20th of the month. Changes in advertisements will be made whenever desired, without cost to the advertiser.

SUBSCRIBERS

The "Electrical News" will be mailed to subscribers in Canada and Great Britain, post free, for $2.00 per annum. United States and foreign, $2.50. Remit by currency, registered letter, or postal order payable to Hugh C. MacLean, Limited.

Subscribers are requested to promptly notify the publishers of failure or delay in delivery of paper.

Authorized by the Postmaster General for Canada, for transmission as second class matter.

Entered as second class matter July 18th, 1914, at the Postoffice at Buffalo, N. Y., under the Act of Congress of March 3, 1879.

Vol. 27 **Toronto, January 15, 1918** **No. 2**

Cold Weather Makes Converts to Electric Heating

The recent record cold snap, coupled with the shortage of coal, has made many converts to the use of electricity for auxiliary heating. This is satisfactory not only in its effect on popularizing electric heaters, but also in that it has operated for real economy and a conservation of fuel.

In this latter connection there is more to the argument than may appear on the surface. The use of electric heaters in the house, for instance, means something more than a mere auxiliary heat to be called into requisition when the coal furnace is unable or unwilling to respond to the demands of several degrees below zero. Like all other machinery, the coal furnace has its maximum point of efficiency, which point is passed when an overload demand is made upon it. It follows then that any overload makes an abnormal demand on the coal bin and that the extra heat so developed becomes more and more costly as the overload is increased. Just here then is where the electric heater comes in. Let us say, by way of example, that the furnace in a certain home, working at maximum efficiency, keeps the temperature at 70 degrees when the outside temperature is zero. If now the outside temperature falls, say, to 10 below, the furnace still working at maximum efficiency only maintains a temperature of 65 degrees within the home. To obtain the extra 5 degrees puts a strain on the furnace, or requires more frequent feeding and attention to such a degree that the cost of the little extra heat required may be two or three times normal, or even more than this.

Then, too, we have the case, quite common, we believe, where one part of the home is required at a higher temperature than the rest. This is especially true of the quiet evening hours devoted to reading or conversation. In such a case the electric as an auxiliary has proven itself ideal, in that it is quick to respond to the demands made upon it and that it delivers heat at the point where it is required—and that point only.

Of course, there is a shortage of electric power at the present time which must have a considerable bearing on the whole question, but when it can be shown that electric heating, used as indicated above, is actually in the interests of conservation, this, along with the additional arguments in favor of electric heaters, should free us from any accusations of advocating a luxury. In the truest sense of the word electric heating, intelligently used as an auxiliary, is conservation of power.

The Acute Coal Situation and Its Moral

The acute situation regarding the coal supply at various points throughout Canada during the past few weeks adds timeliness to a strong article by Mr. Arthur V. White, consulting engineer to the Commission of Conservation, which appears in the annual number of the Monetary Times, under the heading, "Coal Problem of Canada Demands National Action." Mr. White points out that the supply of coal is far from being inexhaustible in the United States and that we may naturally expect to be obliged in the near future to depend on our own resources. In other words, the temporary crisis of the past month will become a permanent condition, the solution of which must rest with ourselves. In that sense our troubles might prove to have been a blessing in disguise if they succeed in impressing upon us the necessity of getting ready for that inevitable event of which we can now, from our recent experience, form some reasonable estimate.

As a substitute for United States coal, which, in all human probability, we shall lose, Canada has two considerable resources, soft coal and water power. Canada may indeed claim to be well supplied with coal, but unfortunately it is of a quality not suitable, in its natural state, for shipment across the continent. One of the big problems before us, then, is to discover some means of economically utilizing this vast resource, it may be by transforming our coal into more stable form so that it will stand shipment, or it may be by converting it at the mines into electric energy and transmitting the power in this form. The latter alternative, however, awaits developments in the electric industry that we may not see in the near future. The former is said to be an accomplished fact but very expensive in operation.

The other substitute—water power—Canada also possesses in considerable degree; Mr. White says roughly twenty million horse-power. Much of this, however, is located so far from our more thickly populated areas that it is, temporarily at least, without value to us. This is all the more reason why we should guard with the greatest care the small fraction of the total found within our useful areas. The better located a water power is, the more reason why its control should be guarded, and also the more vigilance required in properly guarding it, as, naturally, control of such power would be more eagerly sought in proportion as its availability increases.

One does not realize the vast heritage with which the people of eastern Ontario, for example, have been endowed, by simply gazing on the St. Lawrence River. Figures change the viewpoint, however. Let us suppose that the Long Sault is capable of developing 500,000 horse-power continuously. Roughly speaking, it requires ten tons of

coal to provide one horse-power year. **Thus the power of the Long Sault rapids is the equivalent to the province of Ontario of 5,000,000 tons of coal per annum for all time.** The total import of anthracite in 1916 was 4,570,815. Therefore, a proper guarding of our Long Sault heritage alone will take care of the situation when the United States finds it necessary to withhold her anthracite for her own people's use.

How soon that may be is problematical. Our neighbors to the south have been tremendously "white" during the crisis just passed, but let us not forget that their resources are limited, and that charity begins at home. The necessity to withhold export to Canada may arise sooner than they, or we, expect.

For a permanent crisis, such as we have just had a taste of, and which may come to-morrow, shall the people of Canada not do well to hold themselves in readiness, so far as is humanly possible, by conserving for our own people the heritage Providence has willed us?

Abandonment of Aqueduct Scheme Approved by Research Bureau

The abandonment of the plans for enlarging the Montreal aqueduct and for the construction of a plant to develop hydro-electric power, aside from construction required to permit its use as a source of water supply, is recommended in a report by the New York Bureau of Municipal Research, which is investigating Montreal's civic problems. The bureau also recommend that prompt consideration be given to providing funds for the design and construction of an electric power plant to furnish the service required for pumping or other municipal purposes, and that the present steam plant be kept in reserve for stand-by service.

The bureau finds that there has been lack of adequate study and consideration of the project as a whole before authorizing the execution of the works; illogical and conflicting statements in the various reports issued on the subject, and lack of consideration of possible alternatives for securing an economical water supply.

"There is probably no large city on this continent which is so strategically located in respect to the availability of cheap commercial electric power as Montreal. In spite of these facts, the city government has undertaken the independent development of hydro-electric power, practically in direct competition with the private companies at present serving the community in this respect or those able to furnish electric power. The proposed development, if completed, will provide, during certain seasons at least, an excess of power over that required for pumping and other water supply purposes, and yet no well-matured plan has been formulated for the economic utilization of the excess. Even in the matter of municipal needs for electric power, such as, for example, to provide for the lighting of streets and public buildings, there is no evidence of any adequate consideration having been given to the practicability of making use of available power from a city plant for such purpose. It would, then, appear that the city has no reliable data on which to base a justification for undertaking the project at all."

The report criticizes the plans of the city's staff and of Messrs. Vautelet and St. Laurent, and suggests, as an alternative, the abandonment of the proposed power development, the purchase of electric power, the construction of an electric pumping plant for 100,000,000 imperial gallons per day, at a cost of $361,000, the use of the present steam plant as a stand-by, and the use of the aqueduct for water purposes only. The report insists that the purchase of power would prove much more economical as compared with the present hydro-electrical development.

The bureau discusses at great length additional sources of water supply, and comes to the conclusion that the most practical scheme is the utilization of the aqueduct as a source of water supply. This involves the abandonment of the aqueduct enlargement project, including the development of a hydro-electric plant. The construction required to enable using the aqueduct would be limited to the building of an impounding dam at its lower end, with suitable provision for sluice-gates and spillway, together with some possible trimming up of the unfinished sections of the enlargement work.

Flattening Down the Peak

In our last issue we described briefly how the peak load situation was being met in Brantford, Ont., through the co-operation of the various industries throughout the municipality. A recent issue of the Electrical World describes similar operations by the Traction, Light and Power Company in Puget Sound, where Sales Manager Gille has made a successful study of how to relieve power conditions. The salesmen interviewed all power customers over 50 h.p. in an endeavor to secure their co-operation in smoothing out the load curve during the critical weeks preceding and immediately following the new year. In this city the hours of 4.30 to 7 p.m. mark the limits of the critical period. The peak is caused by the overlapping of the lighting and industrial power loads with the electric railway evening rush hour demand. The reason assigned for this overlapping just at this time is that, owing to the number of cloudy and dark days and the consequent shortening of the daylight period, the commercial and residential lighting consumers turn on their lights before the one-shift power load goes off. Power consumers also use lights in their plants which at other times of the year they would not need. The street railway peak is around 5.30 throughout the whole year, and the company is, of course, powerless to shift it.

Calls for co-operation on the part of the power users met with prompt response. Out of 266 customers visited all but two were able to shift their load a little bit. By arranging an earlier closing hour with some 24 customers, 2,600 kw. was taken off the peak. By consulting with other large concerns having numerous employees, plans were worked out whereby these employees should be dismissed at half-hour intervals. This scheme not only relieved street car congestion, but assisted in smoothing out both the street railway and industrial load curve.

Having thus eliminated the more readily recognized overlapping, a systematic study was begun to find just what changes would be most advantageous. Each power consumer's load, with its characteristics, was plotted and listed on a large sheet to facilitate careful comparison. Preliminary examination of this collection of data indicates that it may be more desirable to allow certain power users having unrestricted service contracts to operate on the peak than to ask them to shut down just before that time, because the large number of factory employees who use the street cars may make an increase in the street railway load greater than the factory load cut off.

The Power Controller's Order

Sir Henry Drayton, Power Controller for Canada, has issued an order regarding power conservation in the province of Ontario, which comes into effect Tuesday, January 15. In effect it prohibits display advertising of all kinds; requires the discontinuance of ornamental lighting and the use of only such lamps in ordinary street lighting as are absolutely necessary. The public is also urged to save every little bit of current possible in the office, the home and elsewhere.

The order regarding the discontinuance of ornamental

lighting is probably not intended to be interpreted literally as this would leave the main streets of most of our cities and towns in absolute darkness. Presumably the intention is that only such of the ornamental clusters shall be lighted, or such part of each cluster, as is necessary for a fair illumination.

While this order will work some inconvenience to our citizens in general there is no doubt that they are ready to make whatever little sacrifices may be necessary. As the days lengthen, the inconvenience will diminish. The order is as follows:

"To all Commissions, companies or persons generating, distributing or using electrical energy in Ontario, where there is a shortage of electrical energy, or where electrical energy is being generated or supplemented by steam, gas or oil plants:

"It is hereby ordered and directed that the strictest economy in the use of electrical energy be practised. With this in view the Commissions and companies supplying electrical energy, and the officers of corporations, as well as individuals using electrical energy, will on and after Tuesday, January 15, 1918, and until further notice, see that no electrical energy be used for advertising or ornamental lighting; that electric street lighting be reduced to the utmost possible limit—discontinuing cluster lighting entirely and only using such lamps as are actually necessary for the safety of the public.

"Under the heading of advertising is included the interiors of buildings during hours when the latter are not open for business.

"Turn off every lamp and switch off every heater or motor, the use of which is not absolutely needed.

"Electrical energy is vitally needed for the manufacture of many war essentials, and these can only be manufactured if every user of electrical energy helps in reducing the present general consumption. Coal is being used to relieve the water-power shortage and the costliness and scarcity of coal are well known.

"(Signed) H. L. Drayton,
"Power Controller.

"January 8, 1918."

Ontario Hydro Establishing Testing Laboratories

At the call of the chairman of the Electrical Section of the Toronto Board of Trade, a well-attended meeting of representatives of electrical manufacturers, distributors, and contractors was held in the Board of Trade rooms, Royal Bank Building, on Monday, January 7, at 2 p.m., to discuss the recent announcement of the Ontario Hydro Commission, appearing on page 36 of the Electrical News, January 1 issue. Mr. H. F. Strickland chief of the Hydro inspection department, represented the commission.

Mr. Strickland at some length explained the intentions of the commission. It was proposed to establish a testing laboratory in Toronto, duplicating in its essential parts the laboratories of the Underwriters' Association in Chicago. This laboratory was not intended to supercede the Underwriters' Laboratories, but to supplement their work, its main function being to test and approve such appliances as may be manufactured within the Province of Ontario, or may be offered for sale in the province without having first been approved at Chicago. Mr. Strickland stated that it may be taken for granted that appliances having the approval of the Underwriters' Laboratories would automatically be accepted by the commission in future, just as in the past, and he hoped that reciprocal arrangements would be made in the near future whereby products passed by the Hydro Laboratory would be automatically approved by the Underwriters. At the present time a number of unapproved appliances were being sold in the province, manufactured no one knew where, the distribution of which it was impossible to control. After April 1 it would be a punishable offence to offer such for sale without first having them passed upon by the Hydro Laboratory.

The matter of changes in the rules and regulations of the Hydro Commission was also discussed at some length. A number of members complained that these changes, coming into effect at short notice, had worked hardship in certain cases on those firms carrying considerable stocks of equipment formerly approved, but not now accepted under the amendments. It was thought that the commission might, with profit to both sides, keep themselves more closely in touch with the conditions and sentiments of the trade in general. To this end it was suggested that it would be a move in the right direction if the commission could see its way to include in their Rules and Regulations Committee some outside members of the electrical industry. This suggestion met with unanimous approval, and a resolution was finally adopted which is being forwarded to the commission, requesting that their Rules and Regulations Committee be enlarged to include not less than five members, representing the manufacturing, distributing, and contracting interests.

The selection of names to act on this committee was left over, pending the acceptance of this suggestion by the commission. The intention is that the choice shall be fully representative of the various electrical interests concerned.

Canada an Exporter of Electrical Energy*

Other than the products of her agricultural lands, mines and forests, there are certain resources in Canada of unique and special value. One of these is the hydro-electric energy which may be developed from Canada's waters, including her equity in international waters. At the present time the United States is importing from Canada about 275,000 horsepower years of electrical energy. Many factors, of course, enter into the determination of the equivalent of this electrical power in terms of anthracite coal. Electric power has great advantage for many purposes over steam. Speaking in round figures, and taking cognizance of some of these special factors, the electrical power now imported by the United States would be the equivalent of probably not less than 3,000,000 tons of coal, annually—it may be a quantity substantially greater.

Canada has been richly endowed with water-powers, although those serviceable from the standpoint of present economic development should be carefully conserved so that they may be used in the general public interest.

Any estimate for the water-powers of Canada must be presented and considered with a due appreciation of its limitations. The following table representatively sets forth the water-power situation in Canada. By no means may all the water powers be economically developed:—

Province	Total possible horse-power	Developed horse-power
Ontario	5,800,000	760,000
Quebec	6,000,000	640,000
Nova Scotia	100,000	26,000
New Brunswick	300,000	15,000
Prince Edward Island	3,000	500
Manitoba	.....	76,000
Saskatchewan	3,500,000	33,000
North West Territories		
British Columbia	3,000,000	250,000
Yukon	100,000	12,700
Total	18,803,000	1,813,200

Men far-sighted in the fields of industry and finance have foreseen the extent to which present and future gen-

*From article by Mr. A. V. White, in Monetary Times.

erations will be increasingly dependent upon power, whether it be steam or hydro-electric.

Concentration of Control

In the United States, for many years past, special efforts have been made to concentrate control of water-powers. Most of the water-powers which are more readily capable of economic development in Canada, as well as in the United States, either have been already developed or are privately controlled. Concentration of ownership is a noticeable feature of this control. It has been authoritatively published that in the United States, in 1913, about 6,300,000 horse-power was controlled by ten groups of interests. This concentration is still going on. Owing both to provincial and federal legislation, it has not been possible for interests so readily to obtain control of water-powers in Canada. Efforts, however, are continually being made to secure the rights for such desirable water-powers as are yet vested in the Crown. The efforts made by the powerful financial interests behind the Long Sault Development Company to obtain control of the almost unequalled power rights at the Long Sault Rapids, on the St. Lawrence River, are still in mind.

"Patents" at the A. I. E. E.

Those members of the Toronto Section A.I.E.E. who had the misfortune to be absent from the lecture by Major C. H. Riches on Friday evening, December 21, have much to regret. The subject of the History of Patents has, we are sure, never been presented in so entertaining a fashion; the trading monopolies granted to the Hanse towns in the middle ages, the privileges bestowed upon traders by English monarchs, and the famous act of James I., all were shown to have direct bearing upon the modern form of patent as granted by the Patent Bureaus of Canada, England and the United States. At the conclusion of the lecture a concise summary of the present aspect of patent law and procedure was given. Afterwards Major Riches answered a number of questions fired at him by those members whose inventive genius led them into doubts and difficulties concerning the procedure of securing a patent. The discussion indeed was quite extended, more than forty minutes being devoted to it The lecture was one of the best and most original ever presented before the section, and together with the pleasing personality of the author, yielded a most enjoyable evening.

The 1918 Program

A most attractive program for 1918 has been arranged by Mr. A. H. Hull, Chairman of the Papers Committee of the Toronto Section A.I.E.E. It has been found desirable to hold two meetings in every month (first and third Fridays) and the arrangements are:

Jan. 18.—Commercial Applications of Synchronous Motors, Morris J. McHenry, Canadian General Electric Company, Toronto.

Feb. 1.—The Laws of Dielectrics, Charles E. Skinner, Research Division, Westinghouse Electric Co., Pittsburgh.

Feb. 15.—Technical Education in an Engineering Works, Channing R. Dooley, Educational Department, Westinghouse Electric Company, Pittsburgh.

March 1.—Recent Developments in Transformer Practice, John J. Frank, G. E. Co., Transformer Engineering Dept., Pittsfield, Mass.

March 15.—High Voltage Testing (with experiments), William P. Dobson, Hydro Electric Power Commission Laboratories.

April 5.—High Tension Insulators from the Operating Viewpoint, Paul Ackerman, Toronto Power Company.

April 19.—Annual Meeting, Dinner and election of officers.

The Time to Sell Appliances

Aside from the question of power shortage there probably never was a more opportune time to push the sale of electric appliances than is the present moment. The average small consumer of electric current is making "good money" to-day, and, it goes without saying, is spending it. Supplied, as he is, with comparatively ample means, he is looking about for a little larger share of that comfort and luxury so often denied the man of slender income. What better can he invest his money in than attractive fixtures for his home and modern electric appliances of every sort. Unless, therefore, it is the case that any small increase as this would entail in the household power load will embarrass in any way those who are responsible for supplying the needs of our soldiers, the present conditions of labor, well supplied with ready money, seem to enforce almost a patriotic duty on our retailers of electrical goods to see that this surplus cash is exchanged for merchandise that will add not only to the comfort and pleasure of the working man and his family, but also in a very high degree to efficiency in his daily work.

Honor to Whom Honor is Due

Of the 650,000,000 tons of coal which will be mined this year only 4 per cent. represents the entire electric central station requirements of the country, the greater part of the electrical energy now used being generated in hydro-electric stations. By utilizing water-power the central station industry conserves nature's resources, releases millions of tons of coal, the cars necessary to transport it, and the labor required to mine it, while the coal it consumes, as the fuel administrator himself has graciously allowed, is burned most economically. In view of the wide publicity given to the sign-lighting orders, which indirectly involve the electric lighting industry, it is well that these facts be constantly borne in mind. Fuel-saving, however slight, is vitally necessary in the present world-crisis, but we suggest that as a matter of self-interest any striving for psychological effect be definitely labeled as such. From the usual tone of press reports the general public is led to believe that the central station industry is most profligate in the use of coal, whereas just the opposite is true. There is nothing in the entire engineering history of the industry which, even in the present emergency, warrants anything but praise.—Electrical World.

Canadian Light and Power Win in Review Court

The First Division of the Court of Review, Justices Fortin, Greenshields, and Lamothe, recently gave judgment to the effect that the Canadian Light and Power Company was not liable for the $126,221.35 claimed in connection with the contracts executed by G. W. T. Nicholson at the company's hydraulic plants at St. Timothee, in 1910 and 1911. Mr. Justice Maclennan, in the Superior Court on January 17, 1916, had condemned the company to pay this amount for damages claimed by the contractor, but the review judges held that the claim was not justified. The review judges were unanimous. The action against the company was for $225,692.82, which included the $126,221.35, and as a result of the Court of Review judgment the company will have to pay only $99,471.47 for works executed.

More aid to struggling electric railways in New York State has been granted by the Public Service Commission for the Second District. On December 13 and December 15 the commission announced increases in fares from 5 to 6 cents for the Glen Cove Railroad, and from 5 to 7 cents for the Peekskill Lighting and Railroad Company.

An Automatic Hydro-Electric Station

Four Units of 500 H. P. Each Operate Automatically and Entirely Without Human Supervision

At Cedar Rapids, Iowa, a 2,000 kw., low-head, hydro-electric station recently constructed is now being operated entirely automatically. The installation consists of four 500 kw. units.

The hydro-electric plant has been arranged to operate in parallel with a 19,000 kw. steam generating plant located about half a mile away. It was originally planned to operate the hydro-electric plant by remote control from the steam plant, but as this involved a large number of complications, it was finally decided to install a completely automatic control. In this way a saving in the neighborhood of $4,000 a year in labor has resulted and it has worked out that the first cost is no greater than would have been required for a first class manually operated station. The general operating features are described in a recent issue of the Electrical Railway Journal.

General Operating Features

As the station equipment is arranged and will usually be operated, the control of the machines will be handled remotely from the steam station, where the simple act of removing one small double-throw switch on a bench board will start the automatic control equipment at the hydro plant in its series of functions in placing a machine on the line, without further attention from anyone. These same switches on the benchboard, however, set in the opposite position, leave the number of machines running in absolute control of the automatic equipment at the hydro plant which is actuated by the level of the water in the storage reservoir. The conditions of load will not at any time determine the number of machines cut on or off the line. It will simply be the practice to load the hydraulic plant up to the capacity which the water flow will allow, or which emergency requires, and the load fluctuation on the system will be taken care of at the steam station. If left to the purely automatic control, a lowering of the head beyond a certain level automatically cuts the generators off the line in a certain sequence. Conversely, with a rising head the machines will start up and come in on the line as rapidly as the rise in water level permits. Any trouble whatever instantly cuts the machine or machines out and thus gives protection, regardless of the position of switches at the steam station, and then automatically brings them back on the line when conditions have become normal again. In brief, the complete control scheme includes a purely automatic control on which is superimposed a remote manual control. The former operates in accord with the water supply, while the latter causes machines to be cut in or out at the will of the steam plant operator, by means of the automatic equipment, regardless of water conditions.

As many machines will be run during the day through the remote control supervision as is possible and still permit the river to store up water for full-load operation of the plant during the night. This plan of utilizing the full flow of the river has been adopted as the one which best fits in with the load conditions on the systems. The operation of all three units at the hydro-electric station permits the shutting down of one boiler at the power house during the night.

Special Features of the Layout

The interest in the plant lies principally in the selection and arrangement of the electric automatic control apparatus. The control equipment for the most part, consists of apparatus of standard design for steel-mill work. This type of equipment was selected because of its sturdy and not over-sensitive characteristics. Hence, while the application of the automatic apparatus to the hydro-electric generating equipment is entirely new, the control equipment itself is of usual design, but assembled to perform special duties. This equipment is installed on three generator control cabinets and one exciter control cabinet located along one side of the power plant. There is also a terminal board cabinet which has been used as a terminus for all control and instrument wires. Beside each of the generator cabinets is the motor-driven rotary drum controller which determines the sequence of operation of the various relays and contactors in the same manner that this is accomplished in connection with the automatic railway sub-station. All instrument wires are brought to terminals in the instrument cabinet so that it is possible to cut in portable instruments for testing, in the absence of the permanent meters which are all installed in the steam plant. One feature of the control which differs from that which has been employed in the automatic sub-stations is the over-speed protection device. In the automatic sub-station this is a simple mechanical device placed on the end of each rotary converter shaft, which closes a circuit through a relay when the speed of the machine reaches a certain point, the relay acting to cut the machine off the line. In the hydro-electric plant this protection is provided for the entire station by a 1 horsepower induction motor which drives a speed-limiting device, closing a circuit through a relay in the same manner. As all generators are in synchronism, no one unit could race without carrying all others with it. This motor remains continuously on the line, since it consumes little power, and it was hardly worth while, therefore, to provide relays to cut it off.

Sequence of Operation

The sequence of operation of the control apparatus is in general as follows: When the operator at the steam station closes the small benchboard switch, previously mentioned, the drum controller at the hydro-electric plant starts to revolve. This same connection might have been accomplished by the action of the automatic float switches governed by the water level in the storage reservoir. The first circuit completed by the drum controller is through a relay which starts up one or the other of the exciter sets, depending on which way a triple-pole, double-throw switch is thrown. The 150-h.p. motor of this exciter set is thrown directly across a 2300-volt line, taking momentarily eight times full-load current and coming up to full speed and full voltage in three and a half seconds. Meantime the drum has continued to revolve and has closed the necessary circuit to energize the gate motor which opens the gate on the water wheel to about 0.2 full opening. After completing this contact the drum controller stops until the generator reaches a speed of 55 r.p.m., at which time a centrifugally operated switch on the top of the generator shaft makes a contact which starts the drum revolving again. This then completes the circuit which closes the main line contactor, putting the machine on the line without field and in series with a set of reactors which will limit the current through the unit to about 2.5 times full-load current during the synchronizing period. Two of these reactors, which are of the single-phase oil-immersed type, designed for five-minute duty, are

installed for each machine. A time interval between the closing of the centrifugally operated switch on the main generator and the closing of the main line contactor is provided in order to permit the generator speed to increase from 55 r.p.m. to 60 r.p.m., or synchronous speed, before the main-line contactor is closed. The next function performed by the drum is to close a circuit through the field coils. When the exciting current is first thrown on the generator field, it is limited by the field rheostat connected in the circuit to about one-quarter normal value. This gives the machine a chance to get in step, without unduly high current values. After a moment a section of the field rheostat is shunted out, increasing the field current to its normal value. The current-limiting reactors are then short-circuited and the contact-making ammeter closes a circuit through the gate motor which opens the gate to a point permitting the machine to carry full load. All of these operations require but thirty-seven seconds. The time which elapses from the instant the generator begins to take load until it is under full load is only seven seconds, because of the rapidity with which the gate-opening mechanism responds. In placing the generators on the line the action is similar to that of bringing a synchronous motor up to speed and placing it on full circuit. The ordinary synchronizing process as usually applied to generators does not become a part of the operation in this hydro-electric plant, since placing the machine on the line with low-field excitation allows the rotor to slip back or to be pulled ahead a fraction of a phase angle without trouble. Oscillograph records of the current in the main generator circuit show that maximum disturbance during the starting period is not serious.

Protection Against Possible Trouble

The bearings of each machine are protected against overheat by thermostats of the spiral spring type which are set to operate at 45 degs. C. Should a bearing become overheated, the thermostat would promptly act to cut the machine affected off the line. When the bearing cooled down to normal temperature the thermostat would automatically cut the machine in again. Thermostats are also placed on the current-limiting reactors and set to operate at 75 degs. C. Thermostats on the stator coils of the generators are set to operate at 65 degs. C. The speed-limiting device already described is set so that it shuts down the entire plant whenever the station frequency reaches 64 cycles per second. In a test of this device the main oil switch at the steam station was tripped from the benchboard, cutting all load off the hydro-electric plant, which, of course, would tend to make the machines run away. In one and two-fifths seconds after the oil switch was tripped the frequency limiting device operated and the water wheel gates began to close.

The possibility of a machine operating single-phase is prevented by the fact that part of the relays are installed in each phase, and the wiring is laid out so that the opening of any one of the relays will open all contacts and shut down solenoids, so that no-voltage failures are guarded against through the instant opening of all relays. The loss of excitation is guarded against by a relay in series with contacts which in opening shut down the plant. The generators are protected against surges by inverse time-element relays which cut the current-limiting reactors into circuit with the machine for an interval on not excessive overloads, before cutting the latter off the line. Under normal operation the 220-volt, 60-cycle energy supply for the control system is supplied from two 5-kv.a. transformers installed in the hydro-electric plant. In case of emergency, however, a throw-over switch supplies the control energy from the steam station power and lighting transformers.

The float switches guard against trouble from low water. No special provision has been made to guard against the accumulation of snow-ice, except the standard trash racks at the intake to the flume and at the intake to the wheel pits. In this connection it is interesting to note that a sudden stoppage of all units in the plant produces a piling of the water at the gate to such an extent that the back-wash effectively removes all trash from the rack and causes material which has gathered at the upstream trash rack to be washed over the spillways.

Group vs. Individual Motor Drive

There is always danger when reaction sets in against any certain established practice that the pendulum of modernism may swing a little too far the other way and deprive us of some of the advantages which a moderate viewpoint would have assured. This may be the case to-day with regard to the use of individual motor drives. The reaction which set in some time ago against group drive, based undoubtedly upon sound argument, has in some cases, we believe, led to installations of individual motors not justified by considerations of economy. "Just look at the current you save," is a forceful argument to the factory superintendent who is eagerly searching for every possible opportunity to cut costs, but too often this and similar savings take on an importance quite out of proportion to their real value. The superintendent would see the matter in a different light if he realized that the cost of current represented only in the neighborhood of one or two per cent. of the total operating cost rightly chargeable to that motor.

A very impartial article on the relative advantages of group and individual drive, written by C. E. Clewell, appears in a recent issue of the Electrical World. Extracts from this article are given herewith, as well as a couple of interesting drawings:—

As a basis for an analysis of these two methods of electric drive, it should be noted at the outset that the power consumption of a typical machine tool is usually a relatively small item in comparison with the other charges against the machine, Fig. 1. Any degree of saving in the power consumption will have a relatively small effect on the total cost of production by this tool, whereas any saving in wages brought about by the ability of the operator to perform a given operation in less time will obviously tend to a much greater effect on the cost of production.

The interest and depreciation on a machine tool together may form an item of importance. In this connection Fig. 2 indicates that the cost per horsepower increases rapidly for the smaller sizes of motors; hence the fixed charges on the smaller machine tools when equipped with individual motors are relatively higher than with larger tools where the rating of the motor is higher.

While the use of individual motors can hardly in any case be justified solely on a basis of power saving, any reduction in the power required to drive a given machine is a factor in the gross efficiency of the plant. Table I, therefore, is of considerable interest because it shows the friction losses connected with the line shafting in various typical shop departments. The losses given show the order of magnitude which may be reached, and hence give an indi-

cation of the economy which may be effected by the substitution of motor drive for any system of mechanical power distribution.

Conditions Favorable to Group Drive

In a general way the term "group drive," as here used, relates to those cases where one relatively large motor supplies a group of machine tools through line-shafting and countershafting, the sources of power being broken up into relatively small units. The excessive mechanical losses of the long main-line shafts usually employed with purely mechanical power distribution are thus reduced by the electrical distribution up to the group motors, but the mechanical losses usually present with line-shafting and belting still occur between the group motor and the machine tools to which it supplies power.

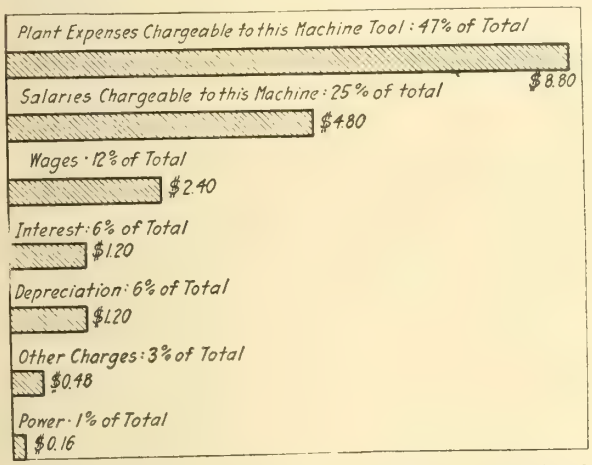

Fig 1.—Relative amounts chargeable to a given machine tool per eight-hour day for different items which make up total production cost.

Several fairly well-defined conditions occur under which group drive is usually preferable to individual-motor drive, and these may be listed as follows:

(a) Group of machines operated at constant speed, all machines being in operation simultaneously.

(b) Machinery close together and countershafts thus short; diversity factor that permits the installation of less gross horsepower with a single group-drive motor than when several individual motors are used. (This case applies with special force to the smaller motors of say 2 h.p. or less.)

(c) Constant-speed machines requiring excessive current at certain points in the duty cycle and when, owing to such conditions, the gross horsepower rating of individual motors would necessarily be higher than the horsepower rating of a single group motor.

(d) Where a group of relatively very small machines is found and where the investment in a motor for each machine be unduly high.

Under any of these conditions, however, the higher first cost of individual motors might easily be offset in a very short period if any considerable increase in production would result from their use in preference to a group motor. Furthermore, the first cost of individual-drive installations has often been increased in the past by the additional cost of mechanically attaching the motor to the machine. This objection is disappearing at the present time because of the growing tendency of the machine-tool manufacturers to design their machine tools so as to accommodate the motor.

The fact that at least 50 per cent. of the output of some of the larger machine-tool plants is now arranged for individual motor-driving is due partly, no doubt, to the increased demand of industrial plants for motor-driven machines, and also to some extent to the appreciation on the part of the machine-tool builders of the advantages of the motor-driven tool.

Advantages of Individual Drive

Turning now to some of these advantages of individual drive, it is important first to note how large a factor the reduced friction losses may be in the individual-motor problem. Figures gathered by A. G. Popcke for a typical case on which careful estimates were made for both methods of drive show that the increased first cost for individual motors may be offset in a relatively short time by the lower frictional losses brought about by their use.

In a case of group drive the total first cost per floor amounted to $8,700, proportioned as follows: For the main shaft, 27 per cent.; countershafts and pulleys, 57 per cent.; group motor, 5 per cent. The losses due to friction with the group system were estimated at $2,500 per annum.

Table I.—Frictional Losses in Shafting for Various Typical Shop Departments

Department	Per Cent. of Total Transmitted Power	Department	Per Cent. of Total Transmitted Power
Pattern making	17	Chucking	26
Grinding	21	Planing	26
Light drilling	23	Cutter making	27
Lathe	25	Heavy drilling	34
Milling	25	Jig and fixture making	37
Cam cutting	26	Cutting off	43

Table II.—Comparative Factors to Consider

Group Drive	Individual Drive
Constant friction loss in shafts and belting.	Friction loss in motor and machine when operating only.
Control of speed limited by the number of cone pulley steps.	Control of speed limited only by the number of notches on the controller and by the gear ratios.
Reversing must be accomplished by a clutch or by crossed belts.	Reversing may be accomplished by the handle of a controller.
Difficulty in stopping the machine tool at any given point.	The machine tool can readily be stopped at any desired point.
Speed increments are usually large.	The speed increments may be made as small as desired.
The size of the cut is limited by belt slippage.	The size of the cut is limited only by the mechanical strength of the machine and by the motor torque.
Difficulty is experienced in locating causes of delay in the work.	Delays in the work may easily be detected by the use of the graphic meter.
Changes in the location of machinery difficulty because shafts are fixed in position.	An individually motor-driven machine may be moved readily to suit the convenience of production.

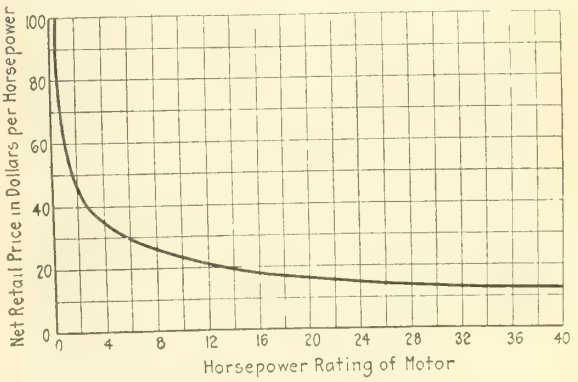

Fig. 2.—Approximate variation in cost per horsepower for different-size motors.

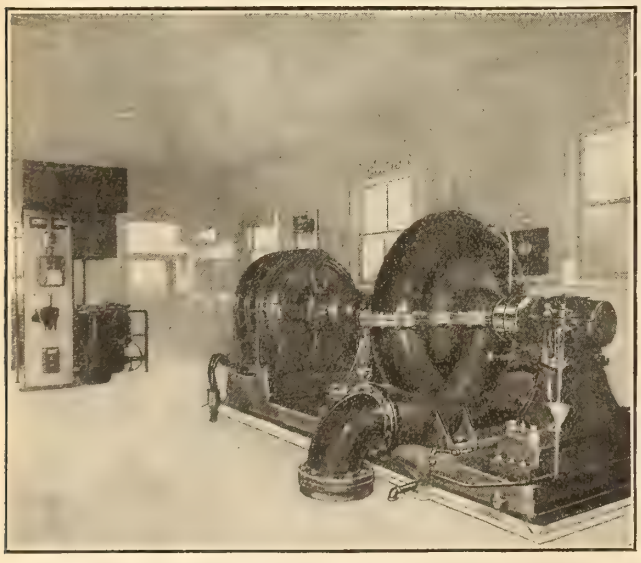
The first cost of an individual-motor drive for this same floor was estimated at about $10,400 per floor, proportioned as follows: For the 136 motors, 83 per cent. of the first cost of the driving system, and for wiring, etc., about 13 per cent. The losses due to friction in this case were estimated at $700 per annum. In this instance the extra first cost of the individual motors amounts to $1,700, whereas the saving in frictional or mechanical losses by the use of individual motors amounts to about $1,800. In such a case, therefore, the increased cost of the individual-motor system would pay for itself through reduced mechanical losses in approximately a year's time.

The principal advantages are power savings (already discussed) and increased production. The latter is brought

about largely by cutting down the time required to perform some or all of the elements which constitute the cycle of the operation. Thus the cycle for a planer includes the time required for (a) the cutting stroke, (b) bringing the platen to rest, (c) reversing the platen, (d) the return stroke, and (e) again bringing the platen to rest and starting in on the cutting stroke. The analysis of the operation of such a machine is largely one of studying how each of the components of the cycle may be affected by the individual motor in comparison with the countershaft or group drive, keeping in mind that a 20 or 40 per cent. saving in the time required for such a cycle means (according to Fig. 1) a corresponding percentage saving in the total cost of production. Obviously, any appreciable saving in the total cost of production by a given machine tool will be an item of great importance to the efficiency of the plant and will be of a magnitude which is far greater than any corresponding percentage saving in the power consumption of the same machine.



The author sums up the relative advantages in Table II.

Pumping Plants Have Equipment Designed for Flexibility

The motor-driven centrifugal pumping plant recently completed at the Riverdale station of the corporation of Toronto is of interest to municipal and other engineers, owing to the great flexibility of speed and capacity of the unit. It was designed to deliver 5,000,000 imperial gallons in 24 hours, against a head of 170 feet, and running at a speed of 720 r.p.m., but owing to probable variation in pressure and capacity the city required the unit to deliver either 3,000,000 gallons or 1,000,000 gallons against a lower head varying from 130 ft. down to 70 ft.

Single Stage Pump With Variable Speed Motor

Under such conditions it is usual to build a multi-stage pump, but the contractors, Canadian Allis-Chalmers, designed and built a single-stage pump which has fulfilled all the guarantees required by the city. The usual practice also is to supply constant speed induction motors for centrifugal pumps, but as the speed to fill the above requirements must vary from 720 r.p.m. down to 50 r.p.m., the Canadian General Electric Company built a special 250 h.p. variable speed motor, which also fulfils all the requirements of the city.

Unit at Riverdale pumping station, Toronto.

This pump is single-stage, split casing, specially designed and constructed to obtain the highest efficiency. It consists of a cast-iron spiral casing with discharge and suction inlet cast on to the lower body. The casing is split on a horizontal centre line, so as to facilitate inspection without dismantling pipe or any other part of the unit.

A set of removable diffusion guide vanes has been provided so as to guide the water from the impeller to the casing in the most efficient manner. The impeller is made of cast bronze, and is polished so as to eliminate unnecessary friction.

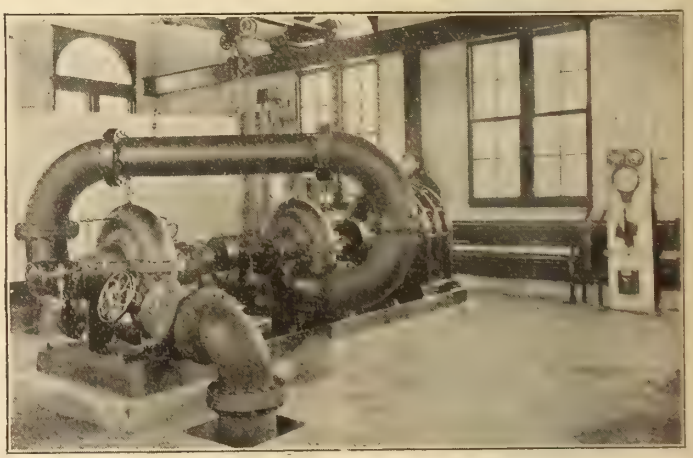
Special neck rings have been provided, so as to decrease the leakage water from the pressure side to the suction side. The impeller is of double suction type and the head of 170 ft. is generated in a single stage.

Proper stuffing boxes are arranged on each side of the extending shaft, and bronze sleeves are provided so as to eliminate rust and undue wearing. The shaft itself is made of the best hammered steel and of ample design to prevent any vibration.

Outboard Bearings for Shaft

Separate outboard pedestal bearings are provided in order to carry the shaft, and one of these bearings is arranged with forged collars, which act as a thrust bearing in order to take care of any unbalanced thrust which might occur occasionally. All bearings are arranged for water cooling, and are of the self-aligning ring oiling type.

Separate sub-bases are provided to facilitate dismantling and direction. Both bearings are tied up to the main pump casing by means of stay bolts, so as to make the whole unit as rigid as possible.



A flexible pin type coupling is arranged for connecting up this pump with the motor. The whole unit is set upon a heavy cast-iron base plate, which is grouted in to the foundation.

The unit has proven to be exceedingly quiet during operation, a point insisted upon in the specification, and to be well over 70 per cent. in efficiency at various tests, and operating under various conditions, which is notable for a single-stage type pump of such comparatively slow speed.

Test of Motor Driven Pumping Unit

The motor-driven centrifugal pumping unit recently installed by Canadian Allis-Chalmers, Limited, at the Papineau Avenue pumping station, Montreal, was tested by engineers on behalf of the Corporation on November 29, 1917, and gave a combined overall efficiency of 75.8 per cent. at three-quarter load to 79 per cent. at overload. The pumps themselves showed an efficiency of 81.5 per cent. to 84.9 per cent.

This unit is composed of two 12-in. type "S" A-C centrifugal pumps and one C. G. E. Co. type I.6—525 h.p., 1,260 r.p.m., Form P, 2,200 volts, 3 phase, 60 cycles, wound rotor induction motor, complete with drum type controller and resistance for two minutes starting duty, and with incoming line panel on which is mounted oil switch and instruments

iron overhead pipe. A decided advantage in adopting this arrangement is the accessibility of all parts during operation, especially such as bearings, couplings, and impellers of the pumps. All bearings are of the self-oiled type, and no bearings are employed inside of any of the pumps. The official test is recorded in Table I.

Personals

Mr. Stanley G. Johnstone has been appointed assistant inspector of gas and electricity for the district of Toronto.

Mr. George Garrett, master mechanic with the Winnipeg Electric Railway, has been appointed superintendent of rolling stock.

Mr. W. S. Hart has been appointed managing director of the Three Rivers Traction Company, Three Rivers, Que. He was formerly secretary-treasurer and general manager.

Mr. G. A. Mills has been appointed electrical engineer of the Winnipeg Electric Railway Company. He was formerly electrical engineer for the Waterloo, Cedar Falls and Northern Railway, Waterloo, Iowa.

Major Harold L. Trotter, A.M.C.S.C.E., has been awarded the D. S. O. Major Trotter, who has been at the front for about two years, with the Canadian Engineers, was associated with Mr. Henry Holgate, consulting engineer, Montreal, for about ten years.

Mr. E. B. Fewings, who has been for six years with the Hydro-Electric Commission of Galt, Ont., the last three years as chairman, has retired. He was presented by the Hydro staff with a handsome easy chair and an address of appreciation was read.

Mr. M. E. McCormick has been appointed assistant to general manager of the New Brunswick Power Company, operating the St. John, N.B., street railway. He was formerly assistant general manager of the Bangor Railway and Electric Company, at Bangor, Me.

Mr. W. S. Ford, Lieut., Royal Garrison Artillery, 122nd Siege Battery, B.E.F., who has been elected an associate member of the Canadian Society of Civil Engineers, was formerly assistant hydraulic engineer with the Canadian Boving Company, designing water power plants, Diesel engine plants, etc., and also with the Western Canada Power Company, Stave Falls, B.C., on power house construction, waterways, surveys, etc.

Mr. W. R. Bonnycastle, of Vancouver, has been elected a member of the Canadian Society of Civil Engineers. He is in practice as a consulting hydro-electrical engineer, specializing on water power development, and is also engineer for the Bridge River Power Company and the Indian Power Company, B.C. Besides being connected with Mr. R. S. Kelsch, of Montreal, on the design of the Kaministiquia Power development, Fort William, Mr. Bonnycastle was electrical engineer with the Stave Lake Power Company, designing engineer with the Western Canada Power Company, and engineer for Smith, Kerry and Chace.

New Books

Radio Communication—theory and methods, with an appendix on transmission over wires, by John Mills, research department, Western Electric Company; McGraw-Hill Book Company, Inc., New York, publishers; price $1.75 net. This book is the substance of a course of lectures given by the author during the summer of 1917 to a company of the United States Reserve Signal Corps. As the individual men differed widely in the extent of their previous training, treatment of the subject involved practically no mathematics. The scope of the work is shown by the following chapter headings: Alternating Currents; The Telephone Receiver; The Vacuum Tube; Detection of High Frequency Currents; Production of Damped Sinsuoidal Currents; Production of Undamped Hugh Frequency Currents; Radio Telegraphy and Telephony; Practical Appliances and Methods of Radio Telegraphy; Transmission over Wire Circuits. The book contains 205 pages, well illustrated; size 5 by 7 inches.

Central Stations—by Terrell Croft; McGraw-Hill Book Company, Inc., New York, publishers; price $2.50 net. After a general treatment of certain elements which occur in all electrical energy distribution systems, the different factors which are utilized frequently in central station practice are discussed more exhaustively. These include load factor, demand factor, diversity factor, plant factor and the like. Next the typical load curves encountered in everyday work are considered; then principles of circuit design, with examples showing how circuits are computed in practice. Chapters follow treating with transmission and distribution, lightning protection equipment, etc. The final chapters in the book are concerned with electrical energy generating stations and the equipment of such stations. These include a study of automatic voltage regulators, switchboards, switchgear; the three different types of prime movers—steam, internal combustion engine and hydraulic; reactors and transformers, etc. The book is in the standard dark green binding of this publishing house; 330 pages; well illustrated; size 5½ x 8 inches.

The Lighting Art—its practice and possibilities, by M. Luckiesh, physicist, Nela Research Laboratory, National Lamp Works of General Electric Company; McGraw-Hill Book Company, Inc., New York, publishers; price $2.50 net. The purpose of this book is to discuss lighting problems, particularly from an unusual standpoint. It is pointed out that engineering and scientific data may be found elsewhere in great abundance, so that the chapters are confined to discussions of scientific and artistic aspects of lighting, with the aim of indicating greater possibilities in the use of light This is a book which will be found of great value, not only to illuminating engineers, but, on account of its non-technical character, to the architect or layman interested in the science of better illumination. It contains 230 pages; size 6 by 9 inches; bound in the standard dark green cloth of this publishing house.

Electric Railways

Montreal Tramways Company Has New Double-Unit Cars in Operation—Control from Master Controllers in Vestibule

The Montreal Tramways Company has just put into operation a portion of 100 new cars, constructed by the J. G. Brill Company, Philadelphia. These are of the double unit type, similar to some now in use except in a few minor details. The trucks and bodies were made in Philadelphia, the cars being assembled and the electrical equipment fitted in the Tramways Company's shops at Youville, near Montreal.

The following gives the main features of the cars:—

Weight, total	motor, 45,000 lbs. trailer, 38,000 lbs.
Seating capacity	motor, 42 trailer, 45
Bolster centres	motor, 21 ft. trailer, 21 ft.
Length over bumpers	motor, 45 ft. 3 ins. trailer, 44 ft. 3 ins.
Length over vestibule	motor, 44 ft. 3 ins. trailer, 43 ft. 3 ins.
Width over all	8 ft. 5 ins.
Rail to trolley base	11 ft. 4½ ins.
Body	Steel with wood posts.
Interior trim	Cherry
Headlining	Agasote
Roof	Arch
Air brakes	Westinghouse
Heaters	Consolidated car
Fare boxes	Coleman stationary.
Lightning arresters	Canadian Westinghouse.
Motors	Canadian Westinghouse 533-T-4; motor cars, 4; trailers, 2; outside hung.
Control	Westinghouse P.K. multiple.
Couplers	Tomlinson.
Designation signs	Keystone.
Seating upholstery	Rattan.
Trolley retrievers	Keystone.
Trucks, type	76 E.
Wheels	Standard cast iron, 30 in.

The cars have the usual fenders, sanders, hand brakes, heat regulators. The air brakes can be applied by either motorman or conductor, while should the cars be accidentally separated the brakes automatically come into operation. The automatic equipment is operated from storage batteries,

Front vestibule new Montreal cars.

making its operation independent of the usual power, and continuous in the event of the current being off. The electric heaters are controlled by a thermostat, with an automatic switch to maintain an even temperature.

The great feature is in the matter of the controller. In the other cars of the company the main controller is in the motorman's vestibule, whereas in the new train both cars are controlled from a master controller placed in the vestibule of either car. In other words, the cars constitute a multiple train which can be run either as a single unit or as a double unit. The use of this Westinghouse type P.K. control also has the advantage of allowing the removal of

Typical new double-unit train of Montreal Tramways Company.

all heavy current carrying parts, and eliminating burnouts in the vestibule. Additional space is also given on the platform, the weight of the latter is reduced, the car wiring is minimized, and greater facility allowed for the application of automatic emergency features on master controllers. It is intended to run these cars on the steeper grades, which hitherto it has not been possible to do to any extent with the other double unit cars.

Each front car is equipped with four Canadian Westinghouse motors, and each trailer with two motors. The total power per double car is 330 h.p., but 600 h.p. can be developed for short periods, 400 h.p. being necessary to operate on the heavier cross town grades. Lighting is by 94 watt lamps with reflectors and automatic compensating device for burned out lamps.

As will be seen from the cut the entrances and exits are of ample proportions, there being a separate exit in the motorman's vestibule of the leading car; the main entrance and exit of this car is at the rear, while those of the trailer are at the front. The doors are interlocked with the power system, making it impossible for the cars to be started until all doors are closed. This prevents accidents to passengers attempting to board cars when the vehicles are in motion.

The experiment with the double cars has proved so satisfactory that the additional cars have been ordered. In a city like Montreal, with its congestion of traffic at rush hours, it is important that the company should be able to transport passengers quickly, avoid delays at intersections, and give facilities for the motorman to move quickly between stops. Of course, other considerations, such as number of stops, enter into the question of efficient service, but in regard to the points previously mentioned, it is claimed that the two unit cars effectively deal with the problems. It is manifest that the double unit cars will carry a much larger number of passengers; that the two cars can receive their loads and discharge the passengers practically in the same time as a single car, given the requisite entrances and exits; that there is less likelihood of delay at the cross sections; and that with fewer vehicles on a route the cars can attain quicker speeds between stops.

Electric Railway Conditions in Halifax

The electric situation in Halifax is described in the current issue of the Electric Railway Journal, who despatched a representative to the scene of action immediately after the disaster. The following extracts are of special interest:

In general, the Nova Scotia Tramways and Power Company's power plant equipment and repair shop proved almost immune from damage, excepting the destruction of windows and doors from the concussion. As might be expected, the rolling stock of the company suffered considerably where it was in service on the streets. Five platform men were killed in the performance of their duties and four of the company's outside mechanics lost their lives. As yet it is impossible to tell how many laborers succumbed. Out of forty box cars in service thirteen are in first-class condition. Two were so badly damaged that they will have to be completely rebuilt. Twenty-five others suffered minor injuries, such as broken windows, door frames blown out or in, warped bodies, etc. One car body was torn off its truck and landed upon a sidewalk at the north end of the city.

Fortunately for the company, very little damage was done to track and roadbed on the system as a whole. The company operated only about one mile of track (60-pound Lorain T-rail) in the worst part of the explosion zone, and this appears not to be in very bad shape. A few cars were started out on the system Friday morning, but unfortunately a blizzard descended upon the city. Automobiles and cars became stalled, and it was impossible to resume passenger service until Sunday morning. On Saturday night 150 United States bluejackets assisted the tramway company in track cleaning. Managing Director H. R. Mallison states that the aid rendered by these men enabled considerable progress to be made in the direction of opening the system for traffic, and that their unstinted service will never be forgotten either by the citizens or by the company. Eight cars were in operation by 10.20 a.m. Sunday. The railway distribution system was not seriously damaged except in the districts closely involved in the explosion. The company is well supplied with line material of all kinds, but is short of car carpenters and glass.

The explosion destroyed the greater part of the overhead lines in the so-called Richmond district of Halifax, as well as in Dartmouth. Breaks and short-circuits in the distribution system of the Tramways and Power Company necessitated the shutting down of the generating plant for a short period, but within an hour the station was again supplying energy through all parts of its territory outside the explosion zone. The fall of overhead circuits, trolley wire, and feeders opened a large number of automatic breakers and switches at the power plant. Practically all the windows and doors on the north side of the station were blown into the building, debris scattering about the operating room for a distance of 40 to 50 feet from the wall. As in many other parts of the city, the tremendous air currents set in motion by the explosion wave knocked down some of the employees. None of those in the station, however, was seriously injured. The windows on the north side of the station were of wired glass, set in steel sashes, but these were blown to bits by the force of the blast. A large amount of glass was blown into the motor-generators near the north wall, and the railway switchboard was also subjected to a shower of this material. Little damage was done, however, either in the station or in the adjacent car repair shop of the company. The boiler-room suffered little, if at all.

Many of the short-circuits on the distribution system were quickly burned out. As soon as possible after the explosion the company's line superintendent and two men proceeded to the vicinity of the North Street station (the Halifax railroad passenger terminal) and cut clear across the city, beginning at North Street, all the overhead lines of the company entering the devastated district. This work was completed during the afternoon.

Prior to the disaster the average peak load upon the power station was 3,100 kw., but the curtailment of demand resulting from the destruction of so large an area has reduced this to about 1,500 kw.

Women Conductors in New York

Women conductors are being used on the New York surface car lines, replacing a large number of men who have been removed by war demands. At present there are about seventy-five in the service, and this number will be gradually increased as positions are left vacant and the women are trained. There is no intention of using women as "motormen." The women will work the same hours as the men they replace and will begin at the same rate of pay. Applications are favored from relatives of men who have enlisted for military service.

When an applicant is accepted she is placed in a school for about two days and afterwards undergoes a test covering familiarity with the company's rules, making change, etc. A certain physical standard is required. During the first few days an instructor accompanies the new conductress.

Standard uniforms have been adopted, made of khaki cloth, similar to the army color. The coat reaches almost to the knees, and has four pockets and a lower inside pocket for carrying transfers. The collar is so made that it can be buttoned in three different positions.

The Dealer and Contractor

Relationship of the Contractor to the Central Station

By W. R. Putnam*

What I am about to present to you I hope you will take in the spirit of co-operation in which it is given. There is no question but what there has been a wonderful change in viewpoint during the past generation. To-day men have a realization that a successful undertaking is impossible in all kinds of industries unless you have the confidence and co-operation of the several branches of the industry. The success of central station undertakings is primarily dependent upon increased business, and no central station can be successful in increasing business unless it has the assistance of all branches of the industry. It cannot work alone, consequently it seems advisable to discuss frankly with the contractors and dealers at this time many of the problems that concern the central station. The central station is first dependent upon the good-will of its customers and, second, upon the good-will of the dealers and contractors in its territory. I appreciate thoroughly that such is the case after having spent some twenty years in the industry, and having worked up to the time where we are securing this co-operation.

Central Station Responsibility

The central station industry has as its responsibility the most extensive use of electrical service, in the territory it is serving, that is possible. That is our aim. We, of course, are employing men whose business it is to secure this business. We have the same responsibility to our stockholders that you have to your stockholders. We must consider the money invested in our business that is entitled to a fair return.

Co-operate to Prevent Stagnation

One place where contractors and dealers can co-operate with the central station is in connection with this situation. You undoubtedly will be interested in knowing that my company did not earn 6 per cent. on the money invested in its business during the past year. This is too small a rate of return. The only way that this can be increased is either by increasing business or by increasing the rates at which current is sold. The central station industry has been affected by the advance in cost of materials the same as your business has been affected, with this difference, that we are not in position to as readily raise rates as are you people. Possibly we will not be able to increase our business to the point where we can pay the increased cost of materials and labor and at the same time pay a reasonable rate of return on our investment. If such a condition happens, you men can be of wonderful assistance in helping the power company to secure whatever raise in rates may at that time be found necessary. You will owe it to yourselves as well as the central station to render this aid as a central station in your territory which is in financial straights will be unable to finance the necessary power developments and extensions to care for increased business, with the result that there will be stagnation so far as the electrical industry in its territory is concerned, which would result in decreased business for all of you men.

Leave Installations to Contractors

In reference to division work between the various branches of the industry the contractor and dealer should, without question, handle installation work in this territory. They also should be very active in the merchandising of all electrical goods, including lamps and appliances. At present you men are handling practically all of the installation work on customers' premises, except in some of our small towns where you are not equipped for this work. As a result, it is our intention to keep out of this class of work. We also aim to have the sale of motors in our territory handled by the contractors and dealers.

Financial Support

As you know, we have assisted contractors and dealers in financing installation work from time to time, particularly with all house wiring. I will grant that we are not doing as much as we might in this respect, but, unfortunately, the central station industry has been hit harder than any other branch of the industry in the present financial situation. We cannot secure money for extension work out of our earnings. We must secure new money to finance all extension work, and money is not to be had at this time. Undoubtedly when financial conditions reach normal we will be able to render you more assistance in financing deferred payment sales of larger appliances.

Will Never Reach Saturation Point

Probably the largest field for additional work on your part is in the sale of additional wiring, fixtures, and appliances for use in the home. We all are interested in securing the greatest saturation possible. However, saturation, as far as the use of electricity is concerned, will never be obtained. There are unlimited possibilities for the electrical industry. We owe to our customers, as well as to our stockholders, the securing of this business, so that our customers will have better and more convenient homes. The central station in its advertising is trying to impress upon its customers, as well as prospective customers, the very many ways in which electric current can be advantageously used by them. This opens up the way for business on your part. The central station has felt that it was necessary for it to take a very active part in this class of merchandising, and I appreciate that this activity on the part of the central station has opened the central station to criticism by you men. However, you must appreciate that our duty requires us to adopt the quickest method of securing this business in order to increase our kilowatt hour sales.

Tremendous Growth in Merchandising Business

Our company has been operating some five years in this territory. Our merchandising business for the first year amounted to $97,000. The first eight months of last year we

* Sales Manager of Utah Power and Light Company, before Utah Society of Electrical Contractors and Dealers.

showed an increase of 63 per cent. over the first eight months of the previous year, and our total merchandise sales for the year will reach approximately a half-million dollars. There is no reason why all of you men should not have increases in your business in approximately the same proportion if you had taken advantage of the conditions. I know that the jobbers, although we buy a considerable portion of our merchandise direct from manufacturers, have had very remarkable increases in business in this territory during this period.

Central Station Publicity Aids General Situation

The contractors and dealers in this territory are not at present properly equipped to handle this merchandising business. You are not ready to spend the amount of money every year required for advertising purposes; you do not have proper display rooms; you do not give the attention to window dressing that is required, and do not have the floor salesmen and other facilities to take care of this volume of business. However, if you have followed the central station advertising you will note that the bulk of their advertising is directed to the education of the consumer as to the advantages of the use of electrical appliances and conveniences. This advertising does not aim primarily to secure this business for the central station, but endeavors to convince the customer of the advisability of purchasing appliances, of the use of better lighting, and of all other types of electric service.

Contractors Should Profit

There is no reason why you contractors and dealers cannot secure very valuable assistance from this advertising of the central station. Allow the central station to continue the work of educating the public and centre your advertising, which need not be nearly as extensive as the central station's, upon directing the attention of electric customers to your store as an electrical centre. Endeavor to secure as permanent customers purchasers who will form a habit of using your store as their electrical centre, their place for solving their electrical problems, and the place at which they will make their purchases of all electrical goods. The greater number of such centres to be established in our territory the better we will be pleased.

Improve Appearance of Store and Windows

You men should gradually improve the appearance of the sales floor of your stores, and particularly of your windows. I appreciate the fact that most of you, in paying a high rent for your stores, are paying a considerable portion of that money for location, and you are wasting that part of your expenditure if you do not take advantage of the location with attractive windows, changed frequently, and with arrangement of goods on your sales floor that has drawing power.

Possibly you have seen the analysis of conditions in San Francisco, recently published. There it has been ascertained that the department stores are doing more electrical appliance business than all of the electrical stores in San Francisco. A similar condition is gradually developing in this territory, and it behooves you men to exert your utmost efforts if you wish to continue the electrical merchandising business.

Fifty Dollars Per Household

In reference to the amount of merchandising business that may be obtained in our territory, there is no reason why every household located where electric service is available should not spend fifty dollars per year for electrical equipment. In this state alone there are from sixty to sixty-five thousand homes using electric service. This means that at least three million dollars a year in wiring, electrical merchandise, and electrical supplies should be secured from these customers. I doubt if one-third of that business is now done in this territory; consequently, there is an immense field for development for new business here, and it does not seem wise for any of us to quarrel over the question of who is entitled to this business, as long as we are securing only a portion of the total possible business.

Maintain Prices

The central station in this territory will continue to cooperate with the dealers in maintaining list prices. We know that no other course is advisable, except in connection with special campaigns. Good merchandising calls for these campaigns. If we are to be successful in merchandising we must to a very considerable extent, adopt department store methods for this portion of our business.

School Building Lighting Code

When you consider that every prospective citizen of our Dominion spends on the average the working part of some ten years of his life in school; that to many pupils school work at best is a highly nervous strain and, finally, that school children themselves have no inherent ideas of conserving their eyesight, we surely have sufficient reason for demanding that the natural lighting of our schools should not only receive every consideration, but that it should be supplemented, on such days and at such periods of the day as natural illumination may prove inadequate, by the most approved aids in the way of artificial lights.

Realizing, as no other body of men can, the prime importance of this feature in our system of elementary education, the Illuminating Engineering Society have prepared a Code of Lighting for School Buildings, extracts from which we reproduce below. While this Code is intended primarily as an aid in formulating legislation relating to the lighting of school buildings, it is also intended for school authorities, architects, contractors and others, as a guide in individual efforts to improve lighting conditions:

The desirable illumination to be provided and the minimum to be maintained are given in the following table,[1] being based upon present ideas of good practice.

Desirable and Minimum Illumination

	Artificial Lighting Foot-candles (Lumens per sq.ft.)* at the work	
	Minimum	Ordinary practice†
Storage spaces	0.25	0.5- 1.0
Stairways, corridors	0.5	1.0- 2.5
Gymnasiums	1.0	2.0- 5.0
Rough shop work	1.25	2.0- 4.0
Auditoriums, assembly rooms	1.5	2.5- 4.0
Class rooms, study rooms, libraries, laboratories, blackboards	3.0	3.5- 6.0
Fine shop work	3.5	4.0- 8.0
Sewing, drafting rooms	5.0	6.0-12.0

*It should be borne in mind that intensity of illumination is only one of the factors on which good seeing depends.

†Under the column headed "Ordinary practice," the upper portion of the range of intensities is preferable to the lower; where economy does not prohibit, even higher intensities than those cited are often desirable.

‡The illumination intensity should be measured on the important plane which may be the desk-top, blackboard, etc.

Glossy Surfaces and Eye-Strain

Glossy surfaces of paper, woodwork, desk-tops, walls and blackboards, are likely to cause eye-strain because of specular or mirror-like reflection of images of light sources,

The following table shows the order of magnitude of the brightness of some light sources in common use:

	Brightness (approximate millilamberts)
Indirect lighting: ceiling, directly above the lighting unit	5. to 75.
Semi-indirect lighting: heavy density glassware	35. to 100.
Semi-indirect lighting: light density glassware	200. to 1,000.
Direct lighting: 10 in. (25 cm.) opal glass ball containing 100-watt vacuum tungsten lamp at center	500.
Direct lighting: vacuum tungsten lamp, (frosted) in open bottom reflector	2,000. to 3,000.
Vacuum tungsten lamp, filament exposed to view	500,000.
Gas-filled tungsten lamp, filament exposed to view	2,000,000.
[illegible]	15,000
Gas-mantle, concealed in 6 in. (15 cm.) opal glass globe	1,000
[illegible]	8,000
Daylight: clear blue sky	1,000.

especially when artificial light is used. Matte or dull finished surfaces are recommended. It is to be noted that a high reflection factor does not necessarily imply a polished or glazed surface.

To minimize eye-strain it is recommended that unglazed paper and large plain type be used in school books. It is recommended that lighting units be of low brightness.

Design of Lighting Installation

The illumination intensity on the horizontal working plane should be as uniform as possible. The variation should not be greater than 4 to 1.

Approximate Coefficients of Utilization—Modern Lighting Equipment

	Light color walls Light color ceiling	Medium color walls Light color ceiling
Small Rooms (Offices, Corridors, etc.)		
Direct lighting; dense glass (open bottom reflectors)	0.40	0.35
Semi-indirect lighting; dense glass	0.25	0.22
Indirect lighting	0.23	0.20
Medium Sized Rooms (Class Rooms, Laboratories, etc.)		
Direct lighting; dense glass (open bottom reflectors)	0.50	0.45
Semi-indirect lighting; dense glass	0.35	0.30
Indirect lighting	0.30	0.25
Large Rooms (Auditoriums, etc.)		
Direct lighting; dense glass (open bottom reflectors)	0.60	0.60
Semi-indirect lighting; dense glass	0.45	0.40
Indirect lighting	0.40	0.38

[2] The flux is measured in lumens. A lumen is the unit of light flux and is the quantity of light required to illuminate 1 square foot of area to an average intensity of 1 foot-candle.

The chief factors which must be considered in arriving at the size and number of lamps to be used in a given room are (1) the floor area; (2) the total luminous flux[2] emitted per lamp, and (3) coefficient of utilization of the particular system considered. The first should be measured in square feet. The second may be obtained from a data book supplied by the manufacturers of lamps. The third involves many factors such as the relative dimensions of the room, the reflection factor of the surroundings, the number of lighting units and their mounting height, and the system of lighting. By coefficient of utilization is meant the proportion of the total light flux emitted by the lamps which is effective on the working plane. In the accompanying table approximate coefficients of utilization for modern lighting equipment are given. The working plane in this case is a horizontal plane 30 inches above the floor. These values refer to the initial installation without any allowance for depreciation.

Determining Size and Number of Lamps

For determining approximately the size and number of lamps to be used in a given room by means of the coefficients of utilization given in the preceding table, it is necessary to know the luminous output in lumens per watt for the electric lamps considered or in lumens per cubic foot of gas consumed per hour if gas lamps are considered. At the present time (1917) the light output of tungsten filament electric incandescent lamps, based on average service conditions of regularly maintained installations, ranges from 8 lumens per watt for the smaller vacuum tungsten lamps to 14 lumens per watt for the larger gas-filled tungsten lamps employed in school lighting. For incandescent gas systems similar service values range from 150 to 250 lumens per cubic foot of artificial gas consumed per hour. The computation for the total lumens required to give a certain illumination intensity in foot-candles is as follows:

N = number of lamps.

L = lumens output per lamp.

E = coefficient of utilization.

A = area of floor or horizontal working plane in square feet.

I = illumination intensity in foot-candles.

Then $I = N \times L \times E/A$

that is, the number of lamps multiplied by the output per lamp in lumens, multiplied by the coefficient of utilization, divided by the area of the horizontal working plane in square feet, gives the illumination intensity in foot-candles.

If the size of the lamps is to be ascertained the computation is made thus:

$$L = \frac{I \times A}{N \times E}$$

To illustrate by an example, assume a room, whose floor (also working plane) is 30 ft. by 18 ft. (9.1 by 5.5 m.), to be lighted by a semi-indirect system from six fixtures containing one lamp each. It will also be assumed that the ceiling is highly reflecting, the walls moderately reflecting, and the illumination intensity desired is 5 foot-candles. The luminous output required of each of the six lamps will be found by substituting the assumed values in the equation, thus:

$$L = \frac{5 \times 30 \times 18}{60 \times 0.30} = 1{,}500 \text{ lumens}$$

Allowing a depreciation factor of 20 per cent. as representing a well maintained installation, the lumens actually required would be 1,500/0.8 = 1,875 lumens. If gas-filled tungsten lamps are considered, whose average output under service conditions is 12 lumens per watt, it is seen that a 150-watt lamp in each fixture will give the desired results.

If gas mantle lamps are considered, whose average output in lumens under service conditions is 250 lumens per cubic foot of gas consumed per hour, it is seen that a lamp consuming 5 cubic feet of artificial gas per hour will be satisfactory in each fixture.

The above example is intended solely to illustrate the method of computation. Estimates of the illumination intensity obtained from an actual installation may also be made by a similar computation.

With the usual lighting equipments the distance between the units should not exceed one and one-half times the height of the apparent source of illumination above the working level.

Edison Electric Appliance Company

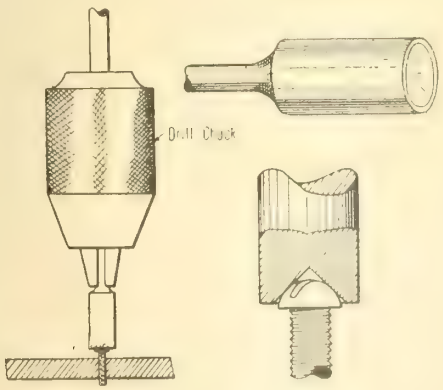
Incorporation is announced of the Edison Electric Appliance Company, Inc., under the laws of the State of New York. This company takes over as of January 1, 1918, the Hotpoint Electric Heating Company and the Hughes Electric Heating Company (with the exception of certain foreign rights, particularly the Canadian business of these companies), and the domestic or household heating device business of the General Electric Company. The industrial heating device and furnace business will not be transferred by the General Electric Company to the new company.

The new company, it is announced, will devote itself actively to the question of standardization of the various devices, which, it is believed by the incorporators, will lead to greatly improved commercial conditions in the distribution of these products by central stations, jobbers, dealers, and other distributing agents.

The new company will operate three manufacturing plants—the Hughes factory at Chicago and the two Hotpoint factories, one at Chicago and one at Ontario, Cal. The General Electric Company's heating-device manufacture now carried on at Pittsfield will be removed to the Hotpoint and Hughes factories at Chicago. Commercial headquarters of the company will be at Chicago. The board will consist of Willis H. Booth, chairman; George A. Hughes, president; A. K. Baylor, vice-president; E. H. Richardson, A. F. Vaughan, G. F. Morrison, C. E. Patterson, and H. C. Houck. W. H. Booth and E. H. Richardson are at present officers of the Hotpoint Company and Messrs. Hughes and Vaughan of the Hughes Company. P. H. Booth, now sales manager

of the Hotpoint Company, will act as sales manager of the new company. The complete factory, engineering, and commercial forces of the Hotpoint and Hughes companies will go over to the new company. Certain of the commercial and engineering representatives of the General Electric Company's heating-device department will go with the new company. This list will include J. D. A. Cross, who has charge of the General Electric Company's heating-device sales, and C. P. Randolph, engineer in charge of heating-device production at Pittsfield, who will both be stationed at Chicago.

It is probable that the new company will continue to sell the three distinct lines of product, namely, the Hotpoint, Hughes, and General Electric devices and ranges.



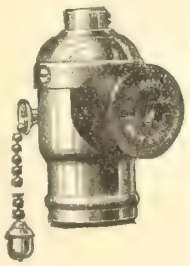
Economy Buys "Arkless" Fuse

An announcement of interest to the electrical industry and to all users of fuses, is made in a letter addressed to the trade stating that the entire fuse business of the Detroit Fuse & Manufacturing Company, makers of the well-known and long established line of "Arkless" enclosed fuses, has been purchased by Economy Fuse & Manufacturing Company, Chicago. The transaction includes the conveyance of all merchandise, materials, machinery, tools, designs, patents, goodwill and unfilled orders. The physical assets of Detroit Fuse & Manufacturing Company, insofar as they pertain to the making of fuses, have been shipped to the Chicago plant of Economy Fuse & Manufacturing Company, where the manufacture of "Arkless" fuses will be continued, production being, as heretofore, under the label service of Underwriters' Laboratories, Incorporated. The same organization will now produce "Arkless" Non-Renewable Fuses—"The fuse with the 100 per cent. indicator"—one of the oldest standard fuses on the market, and Economy Renewable Fuses, the pioneer fuse of the renewable field. Arrangements made well in advance enable Economy Fuse & Manufacturing Company to take over the "Arkless" fuse business without interference with deliveries of either "Arkless" or "Economy" fuses.

It is to be well noted that the "Square D" line of enclosed safety switches remains the property of Detroit Fuse & Manufacturing Company, who will concentrate on its production and marketing.

Driving Round Head Screws

The Electrical Review prints an item by H. B. Stillman describing a device used for driving round-head screws. This device is made by taking a brass or iron rod ⅝ or ¾ in. diameter and counter-sinking one end just deep enough to fit the head of the screw. The drill used in counter-sinking should be sharp at the point so as to leave a conical



hole. A few notches filed in the cone will give the tool a better grip. The writer says that if the screws have a nickel or polished surface which it is desirable to retain, the tool may be made of fibre, in which case there will be practically no danger of marring the finish. This method is said to be much safer than a screw-driver blade, since the latter will often slip out of place and scrape the work.

Best "Jiffy Junior" Attachment Plug

A new solid attachment plug, called the "Jiffy Junior," has just been put on the market by the Best Electric Company, of Pittsburgh, Pa. The "Jiffy Junior" is a solid piece (with separate tip) of asbestos composition. The terminals are moulded right into the plug, and the brass screw shell is die stamped permanently into place, giving it a most substantial construction. By loosening one screw, the tip is removed and the plug is open for wiring. The wires are then cut to even lengths; no knots are necessary, as the right angle strain reliefs securely hold the wires. This plug has the advantage of being quick and easy to wire. It is wired in the open; one screw holds the plug together secure. Its simple design makes it impossible to wire or assemble wrong, and also makes it a practical plug of great economy. Being made of asbestos composition, the plug is, claimed to be indestructible, and is a safe plug to use with any device.

New Hubbell Series

Harvey Hubbell, Inc., are now placing on the market a pull-socket current tap. The device is of the same mechanical construction as the ordinary pull socket, to which has been added a plug receptacle built into the side of the body. It can be supplied with a ⅛ in., ¼ in., ⅜ in., or pendant cap. The flow of current to the lamp base is controlled by the pull-chain. The terminals of the receptacle are continuously in circuit. The use of this socket eliminates the annoyance of

Pul Socket Current Tap.

Toggle Switch.

Showing Interior View of Single Pole Switch.

a long cord running from side wall outlet. Current can be supplied directly beneath the fixture to operate the various table electrical appliances now in general use without the necessity of sacrificing the use of the light.

The same company are also placing on the market an important addition to their line, namely, a five-ampere toggle snap switch, surface type. This switch is illustrated herewith and also was fully described in Bulletin No. 16-2.

Reorganization of Contractors' Association Progresses Rapidly in United States

As was predicted at the recent annual convention of the Electrical Contractors' Association at New Orleans, the various state organizations are rapidly organizing and endorsing the new Goodwin plan of organization. In practically every case adoption of the new constitution was effected in open meeting, at which W. L. Goodwin was invited to explain the details of his plan. Seven states have already adopted the new constitution.

The Square D Company

The Detroit Fuse and Manufacturing Company, having disposed of their fuse business while continuing to manufacture their well-known "Square D" switches, have changed their name to "Square D Company." Future correspondence should, therefore, be so addressed, at Detroit, Mich.

Electrical Candidate for Board of Trade Council

The members of the Electrical Section of the Toronto Board of Trade have long cherished the idea that the importance of the electrical industry in Toronto justifies representation on the council of the Board and are this year nominating a candidate in the person of Mr. E. G. Mack. Mr. Mack is accepting the nomination entirely from a sense of duty and

Mr. E. G. Mack.

in the hope that he may, in considerable measure, change the somewhat indifferent attitude of the general representation on the Board of Trade towards the electrical industry. That he would succeed in doing so goes without saying. A man who has shown such splendid ability in the conduct of his own business, the Crouse-Hinds Company, will naturally succeed in pressing the claims of the industry as a whole.

The Electrical Section of the Board is not big enough to elect Mr. Mack alone, but if to their votes are added the votes of their friends, the thing is done. Every electrical man in Toronto, whether a member of the Board of Trade or not, is urged to use his influence that "electricity" may have a seat at the councils of the Board during 1918.

Regulation of London Cars in Air Raids

At a meeting of London County Council on October 16, Mr. G. H. Hume chairman of the Highways Committee, in answer to questions, stated that it was in compliance with an order isued in November, 1916, by the field marshal commanding the home forces that drivers and conductors had been required to continue their journeys during air raids. In view of recent experiences, however, it had been arranged that cars might be brought to a standstill, and the motormen and conductors might take cover during gun-fire in the vicinity.

The following notice to motormen and conductors, as printed in the Tramway and Railway World, was subsequently issued by Mr. A. L. C. Fell, general manager:

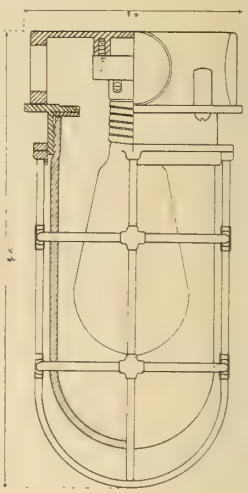
I am now instructed by the commissioner of police to state that in view of the recent experiences it has been decided, with the assent of the field marshal, that notwithstanding section 2 of the order made on November 2, 1916, embodied in general orders Nos. 683 (amended) and 685, cars may be brought to a standstill, and the motormen and conductors may take cover after but not before, anti-aircraft gunfire is heard in the vicinity, and after the following instructions have been carried out:

1. Should any car be on a gradient it must be driven to a section of track which is comparatively flat.

2. Cars must not be close poled.

3. Cars must not be left at intersections of crossing streets.

4. The hand-brake of the cars must be applied to the fullest extent, and the brake ratchet wheels dogged.



5. The controller handles must be removed if a motorman leaves his car to take advantage of the nearest cover.

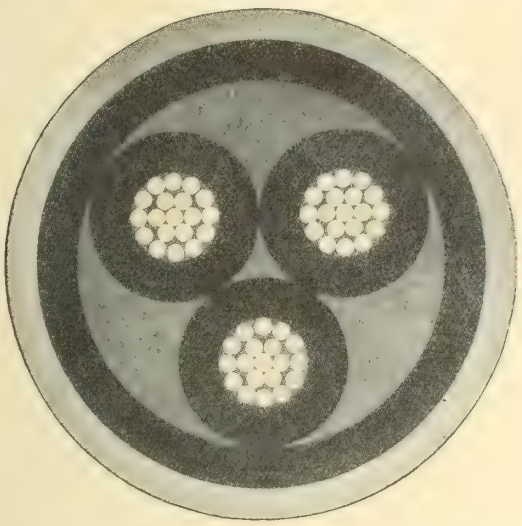
Motormen and conductors should rejoin and proceed with their cars as soon as gun-firing has ceased in the vicinity.

I confidently appeal to the patriotism of all affected by this notice to make these arrangements a success. It is of the greatest importance in the national interest that the tramway services, which are essential for the transport of munition workers and the public generally, should be maintained if possible, and in any case resumed with the utmost despatch when the danger is over.

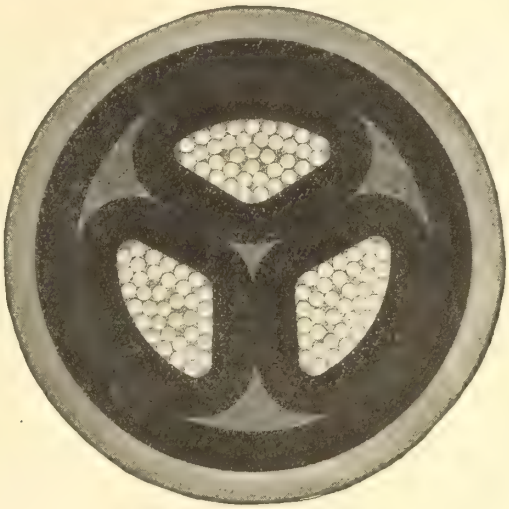
Complete Line of Marine Fixtures

The Steel City Electric Company, Pittsburgh, Pa., announce that they are now prepared to furnish a complete

line of marine fixtures. The cut herewith is typical of this line. The Canadian sales agents for this company are Hatheway & Knott.



The fact that an irresponsible party rings the bell, which gives the signal to the motorman to start his car, does not relieve a railway company from liability for accident, according to a decision handed down by Mr. Justice J. M. Tellier, in an action against the Montreal Tramways Company. The plaintiff was awarded the damages claimed, together with costs of the action.



The final report of the International Joint Commission in the Lake-of-the-Woods reference has just been published in bound form, stiff linen covers. The report covers 260 pages and includes some 54 illustrations. It is the work of Lawrence J. Burpee and Whitehead Kluttz, secretaries respectively of the Canadian and the United States sections of the International Joint Commission.

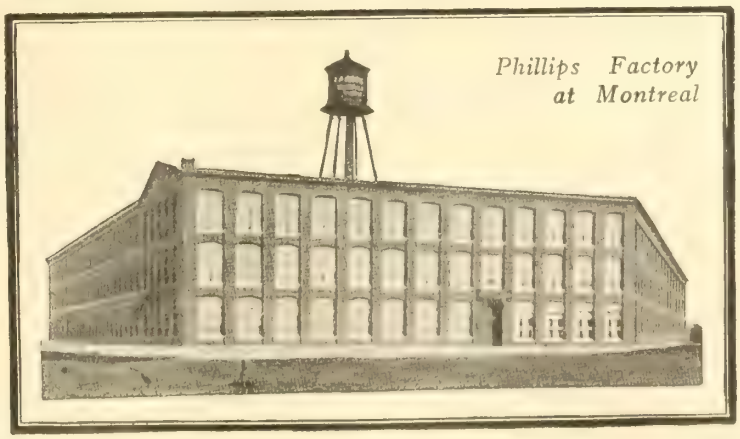
The British Aluminium Company are mailing an attractive 1918 calendar, copy of which may be obtained on request to their head office, 60 Front Street West, Toronto.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Phillips Factory at Montreal

Current News and Notes

Alliston, Ont.

The town council of Alliston, Ont., contemplate electrifying the local pumping plant, and a by-law will be submitted on January 17.

Chatham, Ont.

Plans are under way for operating the Chatham-Wallaceburg division of the Chatham, Wallaceburg and Lake Erie Railway, with Hydro power. Because of the shortage of fuel the company have found it difficult to generate sufficient power for the entire system, which reaches from Erie Beach to Wallaceburg.

Forest, Ont.

A by-law will be submitted to the ratepayers of Forest, Ont., this month, authorizing the purchase of an electric fire engine.

London, Ont.

Benson & Willcox, electrical contractors, 264 Dundas Street, London, Ont., have leased premises at 266 Dundas Street and will fit up first-class electrical sales rooms.

Montreal, Que.

The directors of the Kaministiquia Power Company have declared a dividend at the rate of 8 per cent., an increase of 1 per cent. The dividends have risen from 2¼ per cent. in 1910 to that now declared.

The Montreal Tramways Company have just installed in the William Street power-house a 1,500 kw. motor-generator set. This is the last of four units ordered from the Canadian General Electric Company. Another of the units has been installed at the St. Henry sub-station and two others at the St. Denis sub-station.

Orillia, Ont.

The Light and Power Commission of Orillia, Ont., have made another reduction in rates, amounting to about twenty per cent.

Ottawa, Ont.

The Ottawa Hydro-electric Commission report that the increase in revenue for 1917 over 1916 was $38,000.

Parkhill, Ont.

The ratepayers of Parkhill, Ont., recently passed a by-law authorizing the installation of Hydro service. Work will be proceeded with in the spring.

Sault Ste. Marie, Ont.

Mr. R. T. Jeffries, of the Ontario Hydro-electric Power Commission, was recently in Sault Ste. Marie conferring with the Water and Light Commission in connection with changes in the pumping equipment.

Swift Current, Sask.

The new telephone exchange building being erected at Swift Current, Sask., is now nearing completion. An automatic system is being installed.

Toronto, Ont.

The gross receipts of the Toronto Street Railway Company for the year 1917 were $6,193,562, as compared with $5,891,505 for the year 1916.

By a majority of 36,603 the ratepayers of Toronto voted in favor of the acquisition of the Toronto Street Railway in 1921.

Unionville, Ont.

A deputation from the village of Unionville, Ont., recently waited on the Hydro-electric Power Commission of Ontario with a view to securing an extension of the hydro power system from Agincourt to Unionville.

Windsor, Ont.

The offices of the Hydro-electric Commission at Windsor, Ont., were gutted by fire recently. The loss to building and contents is placed at $85,000.

It is proposed to submit a plebiscite to the ratepayers of Windsor, Ont., in the near future, to determine whether or not public sentiment is in favor of the various municipalities interested taking over the lines and other property of the Sandwich, Windsor and Amherstburg Railway. The company's franchise expires in 1922 and they have refused to make extensions to their lines unless granted an extension of the franchise until 1932. The citizens will also vote on the advisability of extending this franchise and, as an alternative, of the city building the necessary extensions and renting them to the railway company.

Portable Nitrogen Radiator

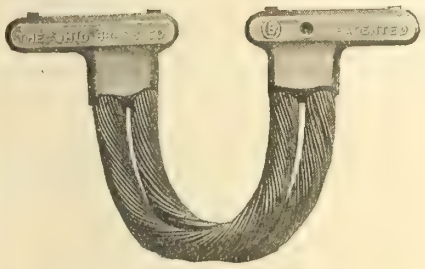
The Willis Manufacturing Company, of Cleveland, Ohio, is offering to the trade a portable electric nitrogen radiator. It maintains an average temperature of 350 degrees Fahr. (176.7 degrees C.) it is said. The radiator contains an electric heating element, surrounded by nitrogen gas. The gas fills the entire inside of the radiator, which is hermetically sealed. The gas serves to carry the heat from the heating element to the radiating surfaces at a temperature higher than that of a steam radiator. The stock radiators are made in four, six, eight, and ten sections. Special radiators may be built in any size or type desired.

Miscellaneous

It is announced that General Electric Company profits for the year ending December 31 will total $27,000,000, a sum nearly $8,000,000 greater than in 1916.

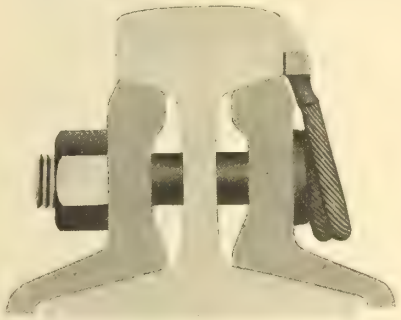
The Crouse-Hinds Company of Canada are distributing an attractive folder showing five color illustrations calculated to demonstrate the care with which this company's various products are packed for shipment. The Crouse-Hinds "boy," of course, appears on the back cover.

An Ontario Government publication entitled "Telephone Systems, 1917," has been published, being extracts from the report of the Ontario Railway and Municipal Board for 1916 and containing statistical and other information relative to the construction and operation of telephone systems. Information is given on 666 separate, independent telephone systems.



Obituary

Mr. George D. Richmond, manager of the Hamilton branch of the Bell Telephone Company, died recently. He was formerly manager at Walkerton and later at Kitchener.

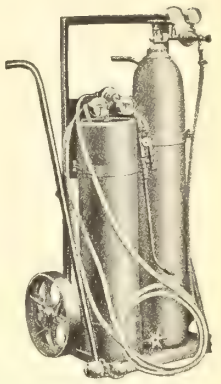


Mr. William Earle, C.E., died recently in St. John, N.B. He was at one time manager of the St. John Street Railway, although latterly was engaged in engineering work for the Dominion Government and the Canadian Pacific Railway Company.

O-B Gas-Weld Rail Bonds

For a Lasting, Low-Resistance Track Return

O-B Gas-Weld Bond
(All Copper Terminal)



Section of O-B Gas-Weld Bond
Installed on Rail

Copper, steel and flux metal unite in a strong, permanent union when an O-B Gas-Weld Bond is put on the rail.

It is a simple process. No special skill is required on the part of the operator. If ordinary care is used every weld is a good one.

O-B Gas-Weld Bonds were pioneers. They were first installed, three years ago, on a Canadian road. Since then over 200 properties have standardized on O-B Gas-Weld Bonds. Constant repeat orders prove their worth.

Oxy-Acetylene Equipment
It may be mounted on any convenient truck.

Electric Vehicles in Postal Service

Electric trucks are being used very successfully by the Postal Department in a large number of cities. St. Louis has had a fleet of electric trucks in its postal service for more than six years which have given splendid service even under the most severe weather conditions. These trucks are in service from 5.45 a.m. to 11.50 p.m., and average 30 miles each day.

The postal service in Boston uses 15 electric trucks, which are operated on the "battery-service" plan. These electrics make runs of 25 miles each day, and have made substantial savings as well as greater efficiency in handling the mail.

The largest electric postal fleet in this country, says the Electric Vehicle, is probably that of the New York Postal Service, which operates 47 electrics. These trucks have been in service for 3 years, and are on duty for two 10-hour periods each day. The dependable, simply operated electric truck has been found almost indispensable in this service, which requires the speedy and safe negotiation of congested traffic.

It is interesting to note, says the same source, that several foreign countries have long appreciated the electric vehicle for postal service. A fleet of 30 electric trucks was installed in Vienna in 1913, and after 1 year's experimentation were pronounced to be particularly satisfactory for the transportation of the mails. This fleet has since been increased to 45 electrics, and one truck has a record of 15 months' postal service in Austria, covering 500,000 kilometers with no interruptions for battery troubles or other repairs.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:

"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

3—25 k.v.a., S. Ph., 60 cycle, A. C. O. C., 13,000 Prim., 220 Sec.

We also have a number of smaller sizes Transformers, 25 and 60 cycles, in most all voltages.

Miscellaneous

Any number of Back Geared Motors, for 3 ph., 60 cycle, 220 volt.
Two Battery Charging Motor Generator Sets.
Five Electric Drills for 110 V. D. C.
Ten Motor-driven Blowers, 110 V. D. C.
Five Ventilating Fans for 110/220 V. D. C.
One 50 h.p. Foss Gas Engine, speed 200, one cylinder with drive wheel 4 ft. x 12 in.; used only three weeks.
500—60 cycle, G. E. and Westinghouse Light and Power Meters, of all sizes and voltages, for immediate delivery.

A complete power plant, in first-class condition, dismantled, crated, and ready for immediate shipment, consisting of:
1—Alternator, C.G.E., 60 cycle, type T.T.B., class 48—600—1501, Form E, volt 2,200, amp. 158, speed 150, direct connected to a Rice & Sargent Providence Engineering Works 18 in. x 36 in. x 32 in. horizontal cross compound condensing engine, complete with condensers; Wainwright horizontal copper tube water-heater; switchboard, piping, and valves. Ask for further information.

WE ALSO HANDLE A FULL LINE OF ELECTRIC RAILWAY EQUIPMENT AND SUPPLIES

Our stock changes daily and above list is only a small proportion of what we have. For further particulars wire, telephone, or write. Let us solve your problems. All engineering service without obligation. We advertise and sell your released equipment without cost to you.

The increase in our business during Nineteen Seventeen proves conclusively that

Quality

is appreciated and is the best advertisement.

TRADE DAUM MARK **Renewable Fuses**

FOR ELECTRIC LIGHT AND POWER

Always were the simplest fuses in construction on the market. The new Type "B," Form 4, has been reduced to the fewest parts—four metal parts of solid brass, a fibre shell and the fuse strip. Caps are removed by a twist of the wrist and as easily tightened, holding the fuse strip in intimate metal-to-metal contact.

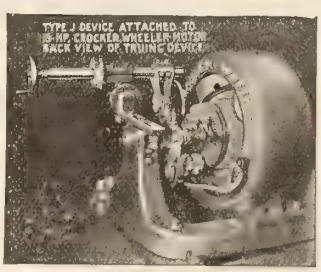
would result in additional competition, which might save your city or town or your client many hundreds of dollars.



The Jordan Commutator Truing Device

Operates without removing armature. No shut down of motor or generator.

No large cuts from commutator and no unnecessary waste of copper.

No dragging of copper causing short circuits.

No portable slide-rest with the danger of the tool digging into the commutator and numerous other chances of damage to the commutator or armature which are all overcome with this machine.

THIS TRADE MARK J O B IS YOUR GUARANTEE

Made in Canada

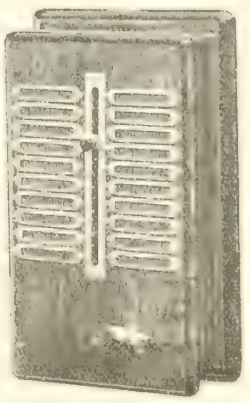
Water Turbines

Hydraulic Governors

High Efficiency Pumps

Vertical Turbines

shown in the accompanying illustration were designed and manufactured by us for the Hydro-Electric Power Commission of Ontario. They are among the largest water turbines installed in Canada and are characteristic of the high efficiency of our engineering department.



The services of these experts are at your disposal to consult on any of your engineering troubles.

BOVING HYDRAULIC & ENGINEERING CO., LIMITED

LINDSAY - ONTARIO

LOSING MEN

It is easy to lose track of a man in a plant of more than two departments. Just when you want him you cannot find him. Sometimes important matters are delayed while you are looking for the man that knows the details.

FINDING MEN

in a plant is also easy after you have installed a Presto-Call System. The Presto-Call is a Signal Service that we make in three sizes to call 5 men, 10 men or 20 men. It is easy to operate, and moderate in price; works with either vibrating or single stroke bells, or horns. The Presto-Call pays for itself in a few months.

Write for Booklet.

Switch Safety

"Square D" Steel Enclosed Motor Starting Switches Permit Efficient Operation of Equipment

Complete enclosure of live parts protects workmen—safety lock-off feature guards against accidental closing of circuit—simplicity of design and absence of interlocking device permits inspection without interruption of service.

The present war crisis demands the adoption of every practical means to insure maximum production.

Our new catalog No. 24 contains valuable information for electrical engineers and operating electricians.

Couldn't make it more accurate—so we made it more flexible.

R. C. O. C. CONTROL

Is now local as well as central.

A new combination lever attachment enables watchmen to close the switch by hand in daylight or night hours to locate burnt-out lamps, or to avoid outages on load controlled by the switches while clearing series troubles. The switches may be cut out of service where White Way Systems are on only on Saturday nights, special occasions, etc. If put out of step by lighting, etc., they can be stepped ahead.

This refinement broadens the scope of usefulness of the R-C-O-C equipment.

At the Power House

At the power-house, using the regular series street circuit for the control wire, the operator controls series White Way systems having combinations of all-night and short-hour lamps on the same circuit, or multiple White Way systems, having all-night or combination all-night and short-hour lamps on the same circuit; or bridge, alley, sign, pump-motor circuits; or (a most important point) pole type or subway Constant Current Transformers, controlling loops of series-circuits. Watchmen, patrolmen, time switches, and irregular lamp hours are things of the past in R-C-O-C installations.

The New 2-in-1 Case

Subway or Pole Type R-C-O-C Switches may now be obtained in the new 2-in-1 case. This is a point to be remembered where manhole space is limited, because two switches in the new case take up little more room than the single switch case, conserving space and weight on pole line installation.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.
Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

SOLENOID SWITCHES

Essential for Modern Street Lighting Methods

This cut shows our Type 17 H.E.P. Solenoid switch which was

ADOPTED BY HYDRO ELECTRIC COMMISSION

of the Province of Ontario and used by them in a large number of Ontario towns.

Orders are received from all the Provinces.

This switch is no experiment. The fact that it has been adopted by the Hydro-Electric is proof of its success.

No springs, switch or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

Write for complete descriptive particulars.

Oxy-Acetylene Welding

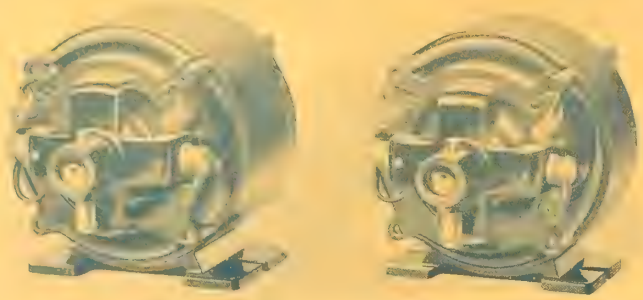
The indispensable adjunct to modern industry

Complete Oxy-Acetylene Welding Plant

The Oxy-Acetylene Welding and Cutting Processes are universally regarded in all Industries as absolutely necessary for all purposes involving the Joining of Metals and Cutting of Wrought Iron and Steel, and especially for the maintenance of machinery. An Oxy-Acetylene Welding Outfit occupies little space; the necessary investment is insignificant; and the advantages to be derived from its use are incomparably great.

Why not have us tell you of its manifold benefits to you?

Being Pioneers of the Oxy-Acetylene Process since its inception and with world-wide reputation and experience, and having Factories in Canada for the manufacture of Apparatus of the highest efficiency and the production of Oxygen and Dissolved Acetylene, enables us to give you an unequalled service for the necessary gases and to give you the most authoritative advice to guard you against possible disappointment in the selection of suitable apparatus.



Write for particulars to-day. Your interest will be appreciated.

Generation, Transmission and Application of Electricity

Our Facilities for Service

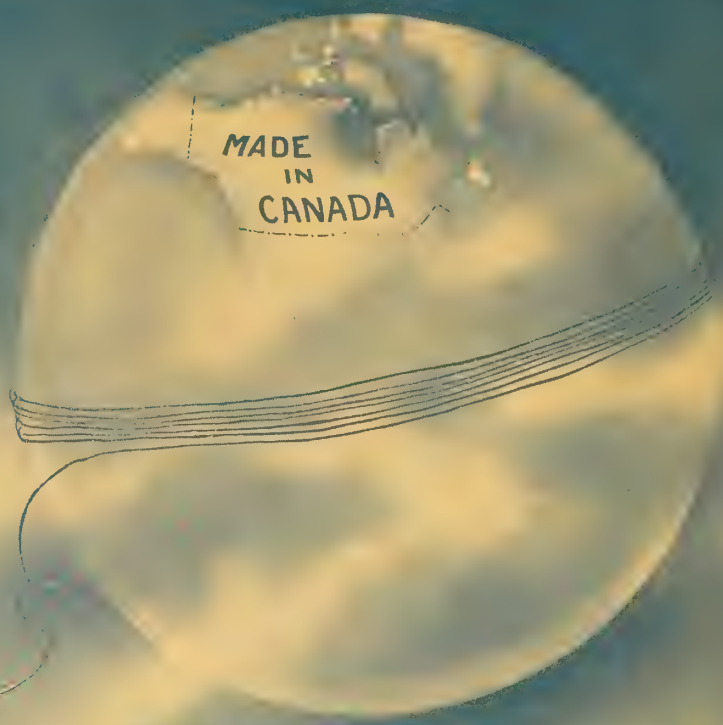
One of the largest and most modern factories in the Dominion.

Unexcelled shipping facilities, both by rail and water.

A complete line of high-grade electric wires, cables, and accessories, guaranteed by an experience (in the United States) of over 35 years in the exclusive manufacture and installation of such products, of which the following is an outline list:

Bare Copper, Brass and Bronze Wires
Copper and Brass Tubes and Rods
Colonial Copper Clad Steel Wire
TRADE C.C.C. MARK
Weatherproof and Magnet Wire
Rubber Insulated Wires
Varnish Cambric Insulated Cables
Paper Insulated, Lead Covered Cables
Fibre Insulated, Lead Covered Cables
Rubber Insulated, Lead Covered Cables
Steel-Wire and Steel-Tape-Armored Cables
Outdoor and Indoor Cable Terminals
Cable Junction Boxes
"Ozite" Insulating Compound
Miscellaneous Cable Accessories

We can generally make prompt shipments from stock of Bare Wire, Weatherproof Wire, Magnet Wire, Rubber Insulated Wire, and Cable Accessories. We are also equipped to render prompt service in supplying products usually made to order, such as Lead Covered Cables, Armored Cables, Junction Boxes, etc.



Write our nearest office for samples, estimates or prices.

Seven Times Around the World

Over 600 miles of Lead-covered Telephone Cable was the output of our plant for one year.

The single telephone wire in this cable amounted to nearly a billion feet or enough to encircle the earth at the Equator more than seven times.

The supremacy of the Northern Electric Company as the largest makers of bare and insulated wires and cables for all purposes has never been questioned.

GOLDEN GLOW GOLDEN GLOW GOLDEN GLOW GOLDEN GLOW

Why You Should Use The Famous "Golden Glow" for Interurban Service

Because "Golden Glow" Headlights for interurban service project a powerful beam of non-blinding, fog-penetrating light—a volume of light which is actually greater than the average arc headlight projects.

Because they offer a wonderful saving in current consumption as compared to arc headlights.

Because "Golden Glow" light is projected in a steady, piercing beam, without flickering.

Because "Golden Glow" Headlights are scientifically correct in principle and design.

Because their reflectors are moulded from special greenish-yellow glass; ground, polished, and silvered by special machinery.

Because "Golden Glow" reflectors will not tarnish or depreciate in value; instead they retain their polished surface and efficiency indefinitely, and can be cleaned without marring their surfaces in the least.

Because "Golden Glow" Headlights will quickly pay for themselves on any railway.

Write for our new "Golden Glow" Catalog now.

UNITY BUILDING - - MONTREAL

Perfect Pressure Control

Can be obtained in tanks and reservoirs by starting and stopping the motor driven apparatus with

THE SUNDH GAUGE TYPE REGULATOR

The simplest, strongest and most satisfactory regulator made. Operates on a pressure difference of 3 to 5 per cent. of maximum pressure. Wider range may be obtained by screwing down the left-hand screw.

The construction consists of a silver-tipped contact lever attached to the tube and moving between two silver contact points on pressure fluctuations.

The screw on the right is used for adjusting to maximum pressure desired, and the lower screw on left hand is for adjusting for difference in pressure.

Send for "Sundh" catalogue giving complete description of controlling devices for A.C. & D. C.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Gentlemen;-

We desire to express our appreciation of the manner in which you handled our order for the three 100 K.V.A. transformers. This order was placed on December 3rd, and to have the transformers shipped on December 19th, taking into consideration that all the drawings and material had to be arranged for after the order was placed, is in our estimation, simply marvelous, and we can not thank you too much for the way in which our order was handled by you.

Again thanking you for your promptness in delivering these transformers and wishing you the Compliments of the Season, we beg to remain,

Yours very truly,

YOU

Can do it—with a GEYSER

"The World's Most Efficient Washer"

You can meet every requirement for size and style—every demand for careful, efficient clothes washing.

The "GEYSER" Principle of Washing is Correct.

A high-speed propeller in bottom of tank forces hot soapy suds through the clothes, which are contained in a constantly revolving cylinder. The entire tank and cylinder space is used. That's why the "Geyser" is simpler, lighter and more compact than any other high-grade washer. Noiseless in operation, attractive in appearance and washes clothes absolutely clean.

ABSOLUTE SAFETY—No moving parts exposed. Safety release on wringer.

EXTREME SIMPLICITY—A motor, a cylinder and two-blade propeller on shaft is the only washer mechanism.

COMPACTNESS—No waste space whatever—can be used in bathroom or kitchen.

Baby Geyser for Use in the Bathroom

NO WEAR ON CLOTHES—Because they are always entirely under hot water, and cylinder runs continuously in one direction.

QUIET IN OPERATION.

ABSOLUTE CLEANLINESS—Inside of tank and metal cylinder both treated by special plating process, making them absolutely rust-proof and easy to clean.

Three Sizes.
Swinging or stationary electric wringers.
Furnished in copper or rust-proof steel, enameled finish

SPHERE HORN GAPS FOR ELECTROLYTIC ARRESTERS

The use of sphere gaps with Canadian General Electric aluminum arresters is the most recent and one of the most important advances in the art of electrolytic arrester design.

All aluminum arresters are now equipped with sphere gaps, excepting those for voltages up to and including 14,000 volts. The diameter of the copper rod used for the horn gaps of the latter arresters is so large in proportion to the gap that the effect is the same as if spheres were used. It may, therefore, be considered that all arresters are provided with sphere gaps.

35,000-volt Three-phase Aluminum Arrester with Sphere Horn Gaps

The advantage of the sphere gap over the horn gap is that the former is "faster" for sudden impulses; in other words, has a shorter dielectric spark lag. A definite time is required to flash over or rupture all insulations, such as air gaps, surfaces and solid dielectrics. The time interval varies with the nature of the insulation, the shape and spacing of the surfaces or electrodes, and the frequency and magnitude of the applied voltage. Differences in the dielectric spark lag, although of infinitesimal time, are appreciable when the rate at which abnormal voltages can be applied in the case of lightning or similar disturbances is considered.

Because of this phenomenon of dielectric spark lag, a voltage in the form of a sudden impulse may not break down what is apparently the easiest path. For example, the voltage may rise beyond the discharge (60-cycle) voltage of the protective gaps, and arc over or puncture insulation having a much higher discharge test (60-cycle) voltage. It follows, therefore, that if protection against lightning disturbances of sudden impulse is to be secured, protective gaps should be as "fast" as possible and the insulation of other apparatus as "slow" as possible.

The needle gap is the slowest kind of air gap; the horn gap is considerably faster than the needle gap but the sphere gap has the greatest speed of discharge. In other words, the sphere gap has the shortest dielectric spark lag.

As shown in the accompanying illustration the upper spheres have horn extensions. The purpose of these is to assist the arc to rise and thus be quickly extinguished. This is not necessary with the lower spheres because, when the arc rises on them, it reaches the upper spheres and is thus extinguished.

Robbins & Myers Fans

JUST stand in front of a Robbins & Myers Fan this way and you'll discover a feature which has a lot to do with the popularity of the R & M Fan. You'll find that the air leaves the fan at an unusually wide angle, and that a large volume of air is moved at a velocity which is just right for real comfort.

And this large volume of air is moved by the fan without a lot of noise and fuss. The design is such that nearly all of the power of the motor is employed usefully in moving the air. Mighty little energy is wasted by the fan blades in churning the air and making a noise.

Even this little 9-inch fan will permit me to stand right up close and at the same time keep well within the cone of moving air. And you'll have to admit that some area is being covered when I'm the target.

If you will demonstrate this feature of the R & M Fan to your customers, you'll find it a big sales help.

Vol. 27 Toronto, February 1, 1918 No. 3

The Country is Waiting for "Daylight Saving" Action

When the Dominion Government convenes it is greatly to be hoped that one of the first questions they will turn their attention to is "Day-light Saving" for the coming summer. There is no disputing the attitude of the vast majority of the population towards this matter—they want the clocks set ahead during five or six months of the summer and they want the practice to be universal, for the Dominion at least, and for the continent if possible. They were decidedly disappointed that no action was taken last year.

The arguments in favor of a universal application of this principle are too well known to require repetition, and in these "shortage" days have double force. The "day-light saving" plan will materially relieve the power situation and have a very direct effect in relieving the food shortage. An extra hour devoted to food production all over the continent every afternoon could easily be made the determining factor between scarcity and plenty, not only at home, but in England and France as well.

But decision should not be left over until the last minute. Individuals and organizations alike want to make their plans in advance. The change should be in effect just as early as it is possible to make it produce any appreciable saving, certainly not later than April 1. By that date most people are losing an hour of good daylight in the mornings in bed, which may well be exchanged for an extra hour in the open air in the afternoon, added to an hour's saving of electric current at night.

There seems to be no doubt that the United States will pass such a bill at an early date to apply to the coming summer months, and Samuel Insull, president of the Chicago Edison Company, estimates that the electrical consumers of his country would be saved seven and a-half million dollars. Mr. Insull not only strongly favors the summer saving idea, but advocates the change being effective the year round, as shown by the following quotation from a recent statement:

"We estimate that daylight saving, if effective for five summer months, would save the electricity industry in Chicago about 15,000 tons of coal per annum, or for the entire country 230,000 tons of coal. It would save the electric light consumers of Chicago $365,000, and of the country about $7,500,000 per annum, this being a loss of income to the lighting companies, with coal the only offsetting saving.

"If daylight saving is made effective throughout the year, the day power load and evening lighting load will not overlap to as great an extent as at present, thus avoiding the sharp peak in load and thereby releasing plant investment for other purposes and making a further saving in coal. Otherwise it would be necessary to fire up additional boilers to cover this peak for a short time each day in the winter months.

"While I favor as a war measure the passage of the bill covering the change for summer months only, if that is all that can be put through at this time, from my experience as a utility operator I very much more strongly advocate a change in time the year round, as that means more available plant capacity throughout the country, which is quite as important as coal in the present emergency."

Power Controller's Intentions Are Not Clearly Defined

Power Controller Drayton has not exactly succeeded in clearing up the problems associated with the supply and use of electric energy. Following his first order, printed in our last issue, page 21, and dated January 8, comes a second, also dated January 8, but differing from the first in a number of essential details. Two very distinct differences are: (1) that the first order applies to "commissions, companies and persons," whereas the second applies only to "company or companies," and (2) there is no penalty clause in the first order, while there is a very considerable one in the second order—a maximum of $5,000 or five years. It is a minor detail, perhaps, that ornamental lighting is prohibited in both, which, strictly interpreted, means that the busiest streets of most of our cities and towns are to be left in total darkness.

The reason for attaching a penalty clause to the order in which "companies" only is mentioned, and omitting it in the order which refers also to "commissions" is not easy to discover. It is entirely unlikely there is any attempt at discrimination. As the matter stands, however, everybody has too vague an idea of the Controller's intentions, and it is to be hoped he will see fit to interpret them more fully, otherwise the object of the order is automatically defeated.

Steel Transmission for Short Lines is Economical

The savings which may be effected by the use of steel in the place of copper in lines of moderate length and load are described in the Electrical World in an article by L. M. Klauber. Figures of his company, San Diego Electric Company, are quoted as follows:

Steel conductors not only effect a saving due to reduced cost per unit of length, but also, owing to greater tensile strength and reliability, permit wider spacings in supports

Poles, cross-arms, insulators and line hardware have all advanced greatly in price and are often difficult to obtain at any price, and the reduction in the cost of supporting structures by the use of steel is as important as the saving in the conductor itself.

The Pacific Coast companies have for some time past used comparatively long pole spacings with copper conductors and wood-pole lines. Standard spans of 350 feet with No. 6 or No. 4 solid, or 450 feet with No. 2 or No. 1 stranded medium hard-drawn bare-copper conductors, have been used extensively without the slightest difficulty.

With the advent of steel conductors it was seen at once these spans could be greatly exceeded with absolute safety. After several branches were put in by the San Diego Consolidated Gas & Electric Company, using ¼-inch stranded steel and 550-ft. spans, 700 ft. was selected as a standard, and many miles of line have been built with spans of this length. Naturally, large sags were necessary with these spans. Although flat construction had always been used in distribution circuits employing copper conductors, the old-style triangular construction, with a pole-top pin, was adopted, with steel to give greater clearance between conductors.

The use of steel conductors and long spans introduces no difficulties. With the greater strains experienced, guying at corners must receive careful consideration. As a rule stubs must be specially heavy and anchored. Anchor guys must be used in quantity; at sharp corners four and six anchors to the pole are occasionally required.

The San Diego Consolidated Gas & Electric Company has now installed in main or branch lines exceeding a mile in length 68.6 circuit miles of steel conductors of ¼-inch, 5/16-inch or ⅜-inch standard steel. In addition there are 25 miles (75 wire miles) under construction. Also there are 52.5 wire miles of ¼-inch steel in constant-current series circuits. Most of the constant-potential circuits are 11 kv., although a few are 2300 volts.

Synchronous Motors at the A.I.E.E.

The activities of the electrical engineer in common with other members of the community are at the present time directed towards economy. In this connection the synchronous motor with its ability for reducing the wattless current on the line is a live topic and Mr. M. J. McHenry is to be congratulated on his choice of a subject for his talk on Friday evening, January 18, before the Toronto Section of the A.I.E.E. The speaker very clearly presented the relative features of synchronous and induction motor plant and showed that where the consumer's rates were based on his power-factor the extra cost of the synchronous plant would frequently soon be absorbed by the reduction in power charges. Mr. P. H. Mitchell, who presided at the meeting, in commenting upon the paper, suggested that the use of synchronous plant might be encouraged by the offer of a bonus to manufacturers who were able to maintain their power-factor above a definite standard. The paper attracted an attendance of nearly sixty, and provoked quite an active discussion.

At the next meeting, on Friday, February 1, an entertaining lecture is to be anticipated from Professor A. P. Coleman, of the University of Toronto. Professor Coleman combines the activities of a traveller with the observant instinct of a scientist and the sense of humor of a man of the world. His address is therefore distinctly one to be attended.

Mr. C. R. Dooley, of the Westinghouse Company, East Pittsburgh, is scheduled to give a paper on "Technical Education in an Engineering Works," on February 15, and two weeks later Mr. R. P. Jackson, also of Pittsburgh, will address the section on the subject, "Commercial and Industrial Research."

Power Controller Issues Second Order

Following the order noted in our issue of January 1st, Power Controller Drayton has issued a second order, as follows:—

Whereas the supply of electrical energy available is insufficient to meet the requirements of users of electrical energy in the districts of Ontario served by power generated by the Niagara River;

And whereas munition plants in whose favor priorities have been declared are still unable to obtain sufficient electricity for the production of munitions that is required;

And whereas it is necessary that the use of electrical energy by users other than those carrying on munition work, or work for the allied governments, and for municipal and public utility requirements, should be restricted—

It is ordered that no company or companies producing, distributing, or selling electrical energy in the districts of Western Ontario where electrical energy developed by the waters of the Niagara River is distributed or sold, shall, on and after the fifteenth day of January, 1918, and until further order, distribute, sell, or supply electrical energy for the use of advertising purposes or ornamental lighting.

And it is further ordered that no purchaser or consumer of electrical energy in the aforesaid districts shall use such energy either for advertising purposes or ornamental lighting on and after the said date; nor use such electrical energy for lighting the interior of buildings during the hours the said buildings are not open for business, except that during said hours such lighting may be used as shall be necessary to protect the buildings.

And it is further ordered that every company, purchaser or consumer of power violating or infringing any of the provisions of this order shall be liable to a penalty not exceeding five thousand dollars ($5,000), or imprisonment for a term not exceeding five years, or to both fine and imprisonment, for every such offence, as provided by the said Order in Council. The said penalty may be recovered or enforced by summary proceedings and conviction under the proceedings of Part XV. of The Criminal Code.

Dated at Ottawa this eighth day of January, 1918.

(Signed) H. L. Drayton,
Power Controller.

Electro-Technical Report

The report of the Canadian National Committee of the International Electro-technical Commission, presented at the annual meeting of the Canadian Society of Civil Engineers, Montreal, stated:

The committee begs to report that during 1917, as in the two years previous, the Commission's activities have, of course, been considerably curtailed, though the central office in London has done all that was possible under the circumstances to keep the organization together and to forward the work.

To this end, and because of the importance of the subject, a conference on the Rating of Electrical Machinery was held in London in September, the meetings being attended by delegates from the British and United States Committees, and by Mr. A. P. Trotter, Consulting Engineer, of London, who very kindly accepted our Chairman's invitation to represent the Canadian Committee. When the work of this conference is finished, and all details settled, another great step will have been made towards world-wide electrical standardization, with all its attendant advantages. For instance, to mention just one, all tenders, whether from manufacturers of the same or different nationalities, will then be comparable on a uniform basis as to performance claims.

guarantees, etc., a condition that has not always obtained in the past, though obviously most desirable.

The Committee has to acknowledge with thanks the continued financial support of the Dominion Government, through the Department of Inland Revenue, whose assistance is much appreciated by both the Canadian members and the central office in London.

Finally, we have pleasure in reporting that Prof. Major L. W. Gill, of Kingston, our member overseas, continues to command his battery somewhere on the French front.

Montreal Electrical Luncheons

Captain R. T. MacKeen, district vocational officer, Montreal, for the Military Hospitals Commission, addressed the Montreal electrical luncheon on January 9 on vocational training work. He gave details of the vocational training and vocational re-education of returned soldiers as it related to the Montreal district, and which is being carried on throughout all military districts in Canada. The former was to occupy the men's minds during the period of recuperation, the work including weaving and woodworking. The re-educational program was framed with a view to utilize as far as possible the previous training of the men, fitting them to occupy positions where they could obtain a livelihood. The men were sent to various industrial plants, after a short term of general educational work, to learn trades, the government paying them $45 for a single man to $95 per month for a married man during the period of training. In this way many who had received injuries which prevented them from following their usual occupations were enabled to learn other trades and to secure satisfactory wages. The department of the Hospitals Commission was thus economizing our man-power and at the same time making the men independent instead of being a burden on the community.

Private J. C. Taylor, a newspaper man, formerly of Calgary and Regina, was the speaker at the Montreal electrical luncheon on January 16. Prior to Private Taylor's speech a vote of sympathy with the family of the late Mr. Charles B. Ellis, one of the original committee of the luncheons, was passed. Private Taylor, who was wounded just prior to the Vimy Ridge battle, gave a very graphic description of camp and trench life and warfare. He referred in detail to the organization for raids, the methods of bombing, and the work done in the trenches. The talk was lightened by the recital of many humorous incidents both of camp and trench. Wounded Canadian soldiers, he also stated, were splendidly treated, both in Great Britain and Canada, and his experience was that nothing was too good for wounded men.

Successful Shawinigan Financing

In a circular issued by the directors of the Shawinigan Water and Power Company, recommending the shareholders to subscribe to a new issue of two-year 6 per cent. convertible notes, some particulars of recent developments are given. Allusion is made to the construction of La Loutre dam, built by the company for the provincial government; this has involved the expenditure of about $2,000,000, which will be paid for in bonds by the provincial government. The dam will increase the capacity of the existing water-power at the low stage of the river fully 50 per cent. In order to adequately supply the territory of the company numerous extensions to its transmission system have been made, including the construction of aerial lines over the St. Lawrence at Three Rivers, additional lines between the Laurentide Power Company at Grand'Mere and the Shawinigan Company's plant at Shawinigan Falls, and the supplementing of plant in sub-stations. With regard to subsidiaries, a further contract for the supply of certain chemicals has been made with the British Government by the Canadian Electro Products Company, extensive additions have been made to the plant of the Canada Carbide Company, while the plant for the manufacture of carbon electrodes has also been enlarged.

Mr. J. E. Aldred, the president of the company, in commenting upon the position of Shawinigan in the realm of electrical enterprises, says:

"It is perhaps not too well known in Canada that the operations of the Shawinigan Company are of such paramount importance in respect to power resources that to-day the company occupies the first place in the consideration of those industrial factors which require for their successful operation the command of large units of electric energy. We have supplanted Niagara in this respect, and it is a matter not to be overlooked that, while in every other part of the country, including the Niagara district, industrial operations have been curtailed through lack of power resources, the district served by the Shawinigan Company and its allies is the only outstanding example of a district which—during war times and especially during the year 1917, when coal conditions were so bad—has had a supply of power fully adequate for all purposes.

"When this is considered, together with the fact that this district has had at its command a greater amount of power per capita than any district in the world, and that the power has been available at lower prices than elsewhere, some idea may be had of the importance of the Province of Quebec as an industrial centre, both at present and in the future."

The credit for this position was not, he added, solely due to the Shawinigan and other power companies as the Quebec Government had adopted "an enlightened policy in fostering and making possible the development of these great power plants, with results which are in marked contrast with those that have been obtained by other methods elsewhere."

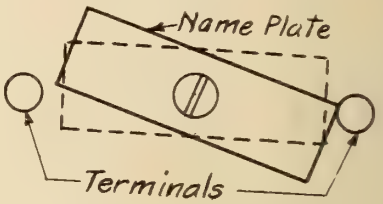
No Dividends in Last Three Years

The annual banquet of the B. C. E. R. Company's Vancouver office staff was held on Friday, December 29, when some 180 members of the staff met in this social event. Mr. George Kidd, the general manager of the company, delivered the speech of the evening, in which he declared that there were three broad divisions—public, employees and investors—which comprise the present-day public utility business. He expressed the opinion that neither the public nor the employees had had anything to complain of, but it was only because the 10,000 shareholders of the company were so far away that they had not been heard from. They had received no dividends in the last three years. The company had gone through a most trying time, Mr. Kidd declared, and had done all in their power to serve both the public and their employees. He thanked the staff for their support during the year. The toast "The Company," was proposed by Mr. A. E. Chamberlain, who declared that the company had been most courteous and generous with its employees.

Mr. W. G. Murrin, assistant general manager, proposed the toast "The Staff," in which he urged a greater co-operation between staff and the management. He declared that the company was going through a most critical period, one that required most hearty co-operation between these two. Mr. J. Munro proposed the toast, "Our Boys at the Front," which are some 495 in number. Mr. C. Woodward made the reply. A musical programme was also given, with selections from Messrs. W. McClellan Moore, W. G. Murrin, W. Menzies, J. Lacey and H. Darlin[illegible]

The Electric Club of Toronto

The Electric Club of Toronto got off to a good start on Friday, January 11, when Major Massie addressed the members and described his experiences and the part he had taken in the famous Passchendaele offensive. The members were most enthusiastic in their expressions of appreciation. On January 18 the programme consisted of a discussion of the new Constitution which the Executive Committee had drafted, and the election of officers under the new requirements. The election resulted as follows: President, Frank T. Groome, sales manager Benjamin Electric Company; vice-president, H. H. Couzens, general manager Toronto Hydro-electric System; honorary secretary, E. I. Jenking, assistant to the president Canadian General Electric Company; honorary treasurer, C. C. Bothwell, Canadian manager Laco-Philips Company; committee, K. J. Dunstan, division manager Bell Telephone Company; George D. Perry, general manager Great Northwestern Telegraph Company; D. H. McDougall, manager Toronto Electric Light Company; W. R. McRae, mechanical superintendent Toronto Street Railway Company; Geo. D. Leacock, sales manager Moloney Electric Company of Canada; B. O. Salter, purchasing agent, Hydro-electric Power Commission of Ontario; W. R. Ostrom, sales manager Northern Electric Company; Walter Carr. Mr. S. L. B. Lines, president and managing director Chamberlain & Hookham Meter Company of Canada, was elected chairman for the balance of January and the month of February.



On February 1 Col. G. G. Nasmith, Ph.D., C.M.G., Director of Laboratories, Department of Public Health, Toronto, will be the speaker and on February 8 Professor Alfred Baker, professor of mathematics University of Toronto, has kindly consented to be present.

Electric Hazards in Bathrooms

The fatality reported recently in Toronto papers resulting when a woman, sitting in a bath, reached out to adjust a small electric heater, must not be taken as condemning the use of that particular heater, or any electric heater, in a bathroom, but rather as a warning that special vigilance must be exercised in the design of heating appliances and that some extra precaution is necessary when they are used in bathrooms. Nothing is to be gained by passing over the matter lightly. Indeed this is a case where it would appear to have been an actual gain if the whole of the circumstances surrounding the incident had been published widely. The impression will have gone abroad, no doubt, that heaters of the same kind as that which caused the fatality are still on the market. This, we understand, is not the case. Though heaters of this make are, of course, being sold every day we are advised that the heater in question is an old type not now being manufactured, and that the objectionable points in construction have long since been remedied. The accompanying figure explains how the accident occurred. The name-plate was held by one screw only, which had worked loose, allowing one end of the plate to fall against a terminal, thus making the frame alive.

The number of accidents in bathrooms can be reduced very materially, if not entirely eliminated, if users will take reasonable precautions. The present Underwriters' and hydro rules cover the ground pretty thoroughly as regards lighting sockets, but it is difficult to control the use of a portable equipment. It would be easily possible to prohibit the use of portables in bathrooms and require that heaters be fixed to the walls or floor at a suitable distance from the danger zone, but there is no means of enforcing such a law. It might be a step in the right direction to make such a rule, however, as the responsibility would then rest with the user. It would possibly be in the general interest if the public were cautioned through the pages of the local press or otherwise, which again might frighten certain people away from the use of them altogether. There seems to be no doubt, however, that the bathroom is the greatest danger point in the home and at any cost the public must be protected as far as it may be humanly possible.

The electrical trade and the public alike can take comfort from the recent announcement of the Ontario Hydro-

electric Commission regarding inspection of equipment. There is no law in Canada at the present time preventing the sale or purchase of unapproved appliances, but on April 1, of this year, that will be changed. After that date it will be illegal to use or dispose of any equipment that does not bear the stamp of approval of either the Underwriters' Laboratories or the Hydro Commission, and no doubt the law will be rigidly enforced. Such a law would, very possibly, have prevented the regrettable accident noted above.

Women as Street Car Conductors

Manager Fleming, of the Toronto Railway Company, does not like the idea of employing women as conductors, and is quoted as saying that "the work is too rough for them." Probably under existing conditions in Toronto this is true, but the Electric Railway Journal is emphatic in its statement that in New York women conductors are a "proved success." In a recent issue they say that the New York Railway Company deserves the thanks of the industry for demonstrating the practicability of the use of women conductors on surface cars and that some 300 women are now so employed. The article also adds: "We see no reason why women conductors should not be employed on many other roads in this country to the benefit of the women and in the interests of good service."

Evidence is not lacking during the recent months that the Toronto Railway Company is having the greatest difficulty in maintaining its former standard of service. The difficulty lies largely, no doubt, with the employees, many of the younger men having been taken for war work and replaced by men of lower standard.

It is probably now driven home to every street car patron in this city that he made a mistake when he raised such strenuous objection years ago to the inauguration of a pay-as-you-enter collection of fares. This, of course, is chiefly where the element of roughness, which in Mr. Fleming's opinion renders the work unfit for women, comes in, and we agree with him. In view of the favorable experience of New York railways it seems reasonable to expect that wherever in Canada pay-as-you-enter systems have been installed, women conductors will gradually make their appearance.

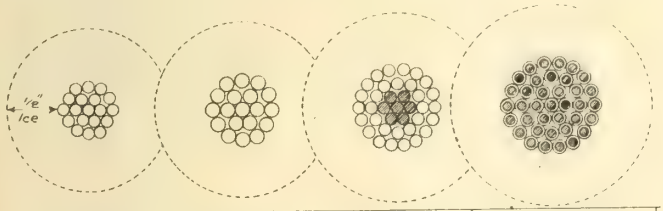
A newspaper report from Gowganda, Ont., states that efforts are being made to re-finance the South Bay Power Company and install a plant at Hanging Stone Falls, the initial development of which will be 350 h.p. The report also states that the Reeves-Dobie Mining Company are behind the proposal and will use the initial power in the working of their properties.

Transmission Line Practice—Sag and Span Problems—II.

By Lieut. E. T. Driver and E. V. Pannell, Assoc. I.E.E.

Correct determination of sag and tension in the line conductors is the most important problem in connection with the mechanical design of the line. If the sags be figured to small excessive strains will come upon the cables and towers, whilst if the wires are strung with a large sag in an attempt to reduce the tension, not only will the towers be high and costly, but the swinging together of conductors must be anticipated. The following article outlines a useful method of predetermining the sag and tension in any conductor making full allowance for span length, wind and ice loads, temperature and other conditions.

Under any conditions the sag of a wire on a span l feet in length is



$$S = \frac{Wl^2}{8T} \quad \ldots \quad (1)$$

where W = total load per foot run;
T = tension in the wire at lowest point.
S = sag in feet at the lowest point.

If W were merely the weight of the wire this law would be a very simple one for calculating sags; as a matter of fact, however, W is the resultant of the weight of the wire and external loading due to ice and wind. The maximum external load will naturally vary according to latitude, but it will be taken in this article as equal to the Class B loading of the National Electric Light Association Joint Committee on overhead crossings. This is commonly regarded as good practice over the greater part of North America and involves the following factors:

Ice, ½ inch thick all round the cable.
Wind, 65 miles per hour or 8 lbs. per square foot on the projected surface of the cable.
Temperature, 0 deg. Fahr.

Under these conditions it is usually assumed that the

COPPER	ALUMINIUM	ALUMINIUM-STEEL	COPPER CLAD STEEL
Equivalent Size c m 211600	211600	211600	211600
Weight per foot lbs .65	322	545	1.47
" " " with ice 1.29	1.056	1.23	2.30
Wind load per foot 1.01	1.11	1.16	1.21
Total load " " 1.64	1.54	1.69	2.60
Loading factor q 2.53	4.74	3.10	1.77
Sag at 0°F. with maximum load feet			
200 foot span 1.65	2.00	1.00	1.00

Stress lbs per sq in 30000	14,000	30,000	37500

Fig. 3—Ice and wind loading on 4/0 equivalent-conductors of different metals.

wires will be stressed to 50 per cent. of their breaking load. Some specifications use the elastic limit instead of this figure, but as the elastic limit is a somewhat indeterminate quantity it is better to assume the figure of 50 per cent. of the ultimate stress, which is somewhat lower. These are assumed to be the worst average conditions under which the line will be expected to operate, and all sag and tension calculations are based upon these. In Fig. 3 these loads are shown as applied to cables of copper, aluminium, aluminium-steel and copper-clad steel, all of which are equal in conductance to No. 4/0 B&S copper. It will be interesting to follow through a series of calculations with these four cables to ascertain their different mechanical properties.

Equation (1), although it does not give very much information, is the basis for all sag calculations. It gives directly the sag which will occur under the most severe conditions of wind and ice load (as shown in Fig. 3). The expression can be made useful by a slight modification.

As already shown, W is the total load, including weight of wire, weight of ice-coating and wind pressure per foot; the actual weight of the cable without loading per foot may be expressed by w; then for W/w we use the symbol q, or loading factor. Further, the tension denoted by T is equal

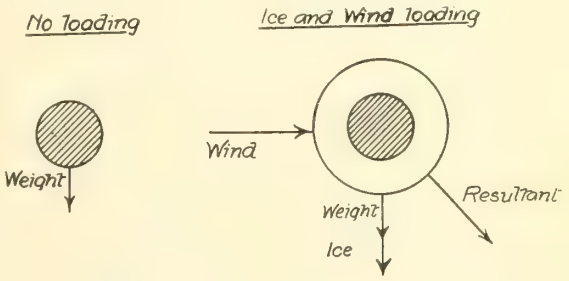

Fig. 4—Method of assuming total loading on wires.

to the stress per square inch multiplied by the area of cable. Therefore,

$$S = q \times \frac{w}{a} \times \frac{l^2}{8F}$$

where F is the stress in lbs. per square inch.

Now the quantity w/a is a constant for the material; for copper it is 3.9 and F, the maximum stress, is also taken as a constant, being 50 per cent. of the breaking load, or 30,000 lbs. per square inch. From this we get:

$S = ql^2/61500$ for copper,
$S = ql^2/93200$ for aluminium,
$S = ql^2/155000$ for aluminium-steel (7 strand),
$S = ql^2/134000$ for aluminium-steel (37 strand)
$S = ql^2/125000$ for aluminium-steel (61 strand),
$S = ql^2/82500$ for copper-clad steel (40 per cent.)

The question that now arises is "how much will the cable sag when relieved of the ice and wind load?" It is clear that the wire, being elastic, will shorten up as the load is removed, and thus reduce the sag, but a graphic method will be used to show just how much this effect amounts to. Now when the external load disappears the sag is

$$S = \frac{wl^2}{8aF}$$

or in other words, q, the loading factor, has also disappeared. Now this equation cannot be solved because there are two unknowns, the sag and the stress F. The other quantities are constant for a given span and material, so we have S = K/F and SF = K; this is the equation of a

rectangular hyperbola which can be easily plotted (Fig. 5). It is obvious that the sag we are attempting to ascertain (that of 0 deg. Fahr, without wind or ice) lies somewhere on this curve.

It is now necessary to consider another property of the wire; its strain or elastic stretch. For the present purpose this is to be considered as a contraction, for, with relief from load, the wire will shorten up. With the maximum

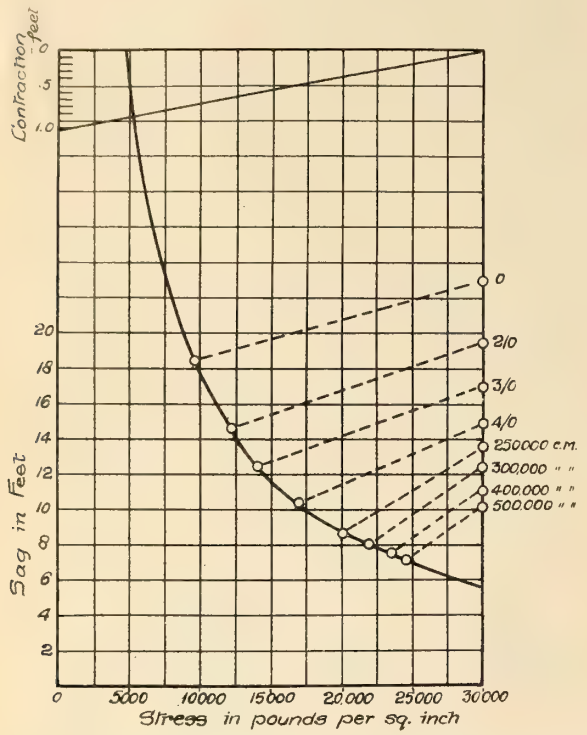

Fig. 5—Chart for calculating the sag on copper conductors when the ice and wind loading is relieved. The curves are based on the following constants: E = 16 x 10^6. Maximum stress = 30,000 lbs. per sq. in.; Ice coating = ½ in.; Wind pressure = 8 lbs. per sq. foot; Span 600 feet.

stress of 30,000 lbs. per sq. in. the value of this contraction is zero, and its maximum corresponds to zero stress in the wire, if that were possible. The value of E, the modulus of elasticity for copper, is 16 x 10^6 and the reciprocal of this (λ) .062 x 1/10^6 gives the feet extension per lb. stress per foot of span. On a 600-foot span with full stress of 30,000 lbs. this amounts to:

$$.062 \times 600 \times 30{,}000 \times 1/10^6 = 1.12 \text{ feet}$$

and this extension or contraction curve is plotted at the top of Fig. 5. The maximum sags on different sizes of cable are easily calculated from the elementary formula (1) and these all plotted on the maximum stress line (30,000 lbs.).

Now there is a very elementary law connecting the length of wire with the sag and this can be modified to give the change in sag corresponding to a change in length:

$$L_1 - L = -\frac{8}{3l}(S_1^2 - S^2) \quad \ldots \ldots \ldots \ldots \ldots \ldots \quad (2)$$

where

L_1 = total length of wire,
L = total length of wire after load is relieved,
l = length of span,
S = sag before load is relieved.
S_1 = sag after load is relieved.

($L_1 - L$) is, of course, the contraction, and this is given by the curve at the top of Fig. 5, and, taking the values from this, it is easy to solve equation (2) finding new values of sag corresponding to those of contraction. Plotting these figures it will be found that the sag decreases rapidly as the wire contracts and ultimately the sag curve cuts the hyperbola. This intercept immediately gives the required value, i.e., the actual sag of the wire when ice and wind loads are relieved.

Of course, in practice it is not difficult to find a value of sag very close to the hyperbola, and thus obtain the intercept in one operation without plotting a sag curve.

Fig. 5 is a very useful chart to have and it should be prepared for every span in general use, and for copper, and any other materials which are to be figured upon.

All the foregoing operations refer to constant temperatures, the sags already calculated being at 0 deg. F. It is now necessary to ascertain the increase sag with rising temperature. Since the wire has a definite percentage increase in length for every degree rise it follows that the sag will also increase. However, as the wire lengthens the tension will naturally diminish and the contraction we have already studied comes into play. Just what is the net effect of these two changes it is now proposed to enquire, for unless allowance be made for both of them it is impossible to calculate the true sags at the maximum summer temperature.

Suppose that $L_1 - L$ again represents a change in the length of the wire, but this time due to warming up of the surrounding air; this change is also equal to $l\alpha t$
where l = length of span,
α = per cent. increase in length per 1 deg. F.
t = rise of temperature F. deg.

(correctly L, the length of the wire, should be used in the above instead of l the span length, but the use of the latter

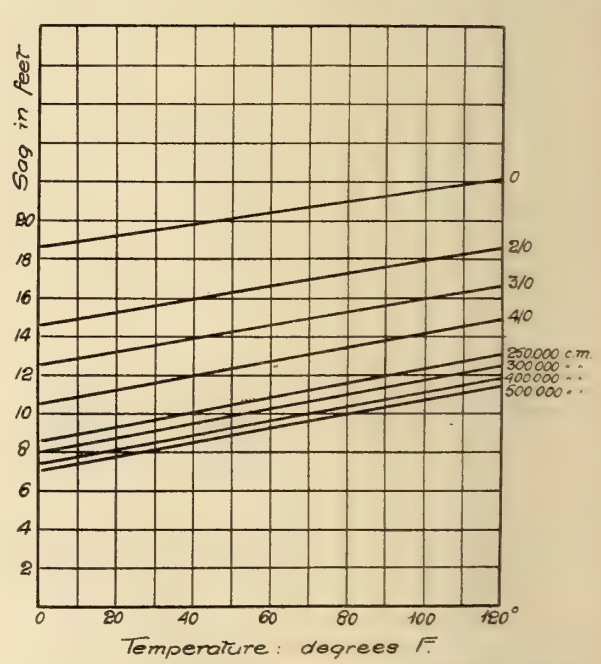

Fig. 6—Curves showing increase in sag from 0° to 120° F.; copper cables, 600 foot span. The sags at 0° F. are derived from Fig. 5.

quantity introduces only a negligible error and greatly simplifies the operation).

Now from equation (2)

$$(L_1 - L) = -\frac{8}{3l}(S_1^2 - S^2) = l\alpha t$$

so that

$$t^\circ = \frac{8\,(S_1^2 - S^2)}{3\,l^2\alpha} \quad \ldots \ldots \ldots \ldots \ldots \quad (3)$$

This relation would be quite true if the material were absolutely non-elastic, as we might imagine of some extremely

soft metal. However, as this is not the case, a simple correction must be made;

Let λ = extension per lb. stress

a = extension per 1° F

$$\text{and } \frac{a}{\lambda} = \beta$$

now when the sag changes as above from S to S_1 there is a change in stress from F to F_1 and as was shown by the curve in Fig. 5 $F_1 = \frac{FS}{S_1}$

and the temperature for any given change in sag is

$$t^\circ = \frac{8(S_1^2 - S^2)}{3\,l^2 a} + \frac{F_1 - F}{\beta} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots (4)$$

From this it is easy to plot out a sag-temperature curve which is found to be a straight line. Furthermore, because the product of sag and stress is constant for all temperatures a table of tensions can be prepared from the foregoing which will give the necessary dynamometer pull at the temperature of erection. In Fig. 6 a temperature-sag chart has been prepared for different sizes of copper cable on a 600-foot span, and in Fig. 7 values of sag, stress and temperature are given for different materials of conductor all for a 600-foot span. It would have been interesting to follow out this study so as to include shorter and longer spans also, but sufficient information has been given to enable this to be done.

The sizes of conductor in Fig. 7 are equivalent ones, that

Fig. 7—Sag in feet and stress in pounds per sq. in. for different classes of cable on a 600 ft. span. Maximum loading is ½ in. ice and 8 lbs. wind at 0° F.

is, the size of copper-clad referred to as 4/0 is not actually that size, but is the one which is exactly equal to 4/0 copper in resistance. Thus all the different metals are compared on a common basis of conductance. Taking for an example the 4/0 size it will be seen that the maximum sag with aluminium-steel or copper-clad cables is about half that obtained with copper, whilst straight aluminium gives a sag 50 per cent. more than copper. These relations vary for different sizes and spans and should, of course, be worked out in each case. Copper-clad wire corresponds very closely to aluminium-steel in its sags so that they would both require the same height of tower. The tension on the copper-clad cables is very much higher, consequently the towers would have to be of heavier sections in this case. It is more than likely that in the majority of cases aluminium-steel cables would be used for the standard conductor with a copper-clad conductor of smaller section for any abnormally long spans. Very long spans (e.g., the Straits of Carquinez, California, 4400 feet; and the new crossing of the St. Lawrence, 6600 feet) are always operated with plow-steel cables because the necessity of maintaining clearance above a navigable waterway calls for the minimum sag. In installations of this kind, however, it will sometimes be found that a compound conductor, whilst yielding a greater sag than steel, will require much lighter and cheaper towers, due to the lower tension.

Before leaving the subject of sag calculation, attention might be drawn to the fact that the equations in this article are based on the assumption that the wire lies in a parabola, whereas the actual curve is much nearer a catenary. As a matter of fact, however, the small percentage error introduced is much less than that existing in the assumptions of the physical properties of the material. No authentic tests have been published to demonstrate whether the value of E for copper cables is correctly assumed at 16 x 10^6 and this figure is quite probably 10 per cent., and possibly 15 per cent. in error. Until these properties have been thoroughly established the laborious calculations involved in the catenary method are at least an inconsistency.

[The third article of this series will appear in the issue of March 1, and will deal with "Poles and Towers."—Ed.]

Reorganization of Power Situation in England

The situation as regards fuel and power in England is such as to demand greater economies in operation, and some time ago a coal conservation sub-committee of the University of Reconstruction was appointed. Their report has just been tabled and the following summary made public. A main feature is the organization of some 600 smaller systems into 16 districts, in each of which the generation and distribution shall be under one head. These, after the war, should be gradually superceded by more efficient and modern equipment, so planned and located as to be capable of extension. Existing inefficient plants should not be allowed to extend or enlarge. The recommendations, so far as published, are as follows:

Recommendations

(1) It is essential that the present inefficient system of over 600 districts should be superseded by a comprehensive system in which Great Britain is divided into some sixteen districts, in each of which there should be one authority dealing with all the generation and main distribution.

(2) Centres, or sites, suitable for electric generating purposes should at once be chosen on important waterways, as the future main centres of supply for each of the districts into which the country is to be divided.

(3) The sites so chosen should be as large as possible, having in view the land available in suitable localities, and should have ample water and transport facilities. Land is required not only for the power stations themselves—which for the sake of security and safety would have to be suitably sub-divided, that is, they would not be contained all in one building—but for the processes involved in the extraction of by-products from the coal before it is used for the production of power, where such extraction is found to be justified. It is also required for the development of electro-chemical processes, which may be most conveniently carried on in close proximity to the power plant. This condition entails the sites being chosen outside, not inside, towns. (The health of the great industrial centres and the congestion of the railway lines in their neighborhood would be radically improved by arranging that the conversion of coal into motive power was carried out away from the densely populated centres).

(4) Plans should be prepared for the construction immediately after the war on these sites of the first instalment of large super-power plants capable, first, of supplying, through a comprehensive electric power distribution system which must also be arranged for, the existing demands of the community; and, secondly, of supplying electrical energy at the lowest possible price for new processes and manufactures.

(5) Such plants would be designed so that, as methods

are perfected for extracting by-products from the fuel, before using it for the purpose of the production of electric power, the by-product plant can be combined with the power plant. Each site should be laid out with this in view, and with a view to the unrestricted extensions of the plant as required.

(6) Power available from surplus gas or waste heat should be turned into electrical energy on the spot in local plants which would feed into the main distribution system. As regards waste coal—i.e., coal which it does not at present pay to bring to the surface—this could, where transport was the ruling consideration, also be used on the spot.

(7) Once these plants are in existence it would be possible for existing authorities, without any risk of being left in the lurch, to stop extensions of their own uneconomical stations, situated as they mostly are on cramped and unsuitable sites, and to arrange to take their power from the main system.

(8) With a view to carrying out the policy advocated a Board of Electricity Commissioners should be appointed, with full powers to deal with the electricity supply situation throughout the country. They should have power—inter alia:—

(a) To stop the extension or multiplication of uneconomical stations for public supply.

(b) To arrange for the handing over, on equitable terms, of the generation, transmission and main distribution system in each of the areas into which the country is to be divided, to a new electricity body appointed for the area.

(c) To standardize for each area the frequency and voltage of the main transmission and distribution system.

(d) To settle for each area whether such body should consist of a Parliamentary company working under adequate control as regards limitation of dividends, etc., or one of the other alternatives given in Appendix C.

(9) Alternative types of the new electric power organizations are described in Appendix C. In reference to these alternative types the Sub-committee are impressed with the special need for initiative and resource in the management of the business of power supply, and they are of the opinion that the freedom of range and keenness which are distinctive of private enterprise will be found to be in a high degree conducive to the fullest measure of success. The Sub-committee consider that if the nation is to get immediately an efficient power supply, and is to take advantage of the temporary lull in manufacturing output immediately after the war, State assistance in some form may be necessary.

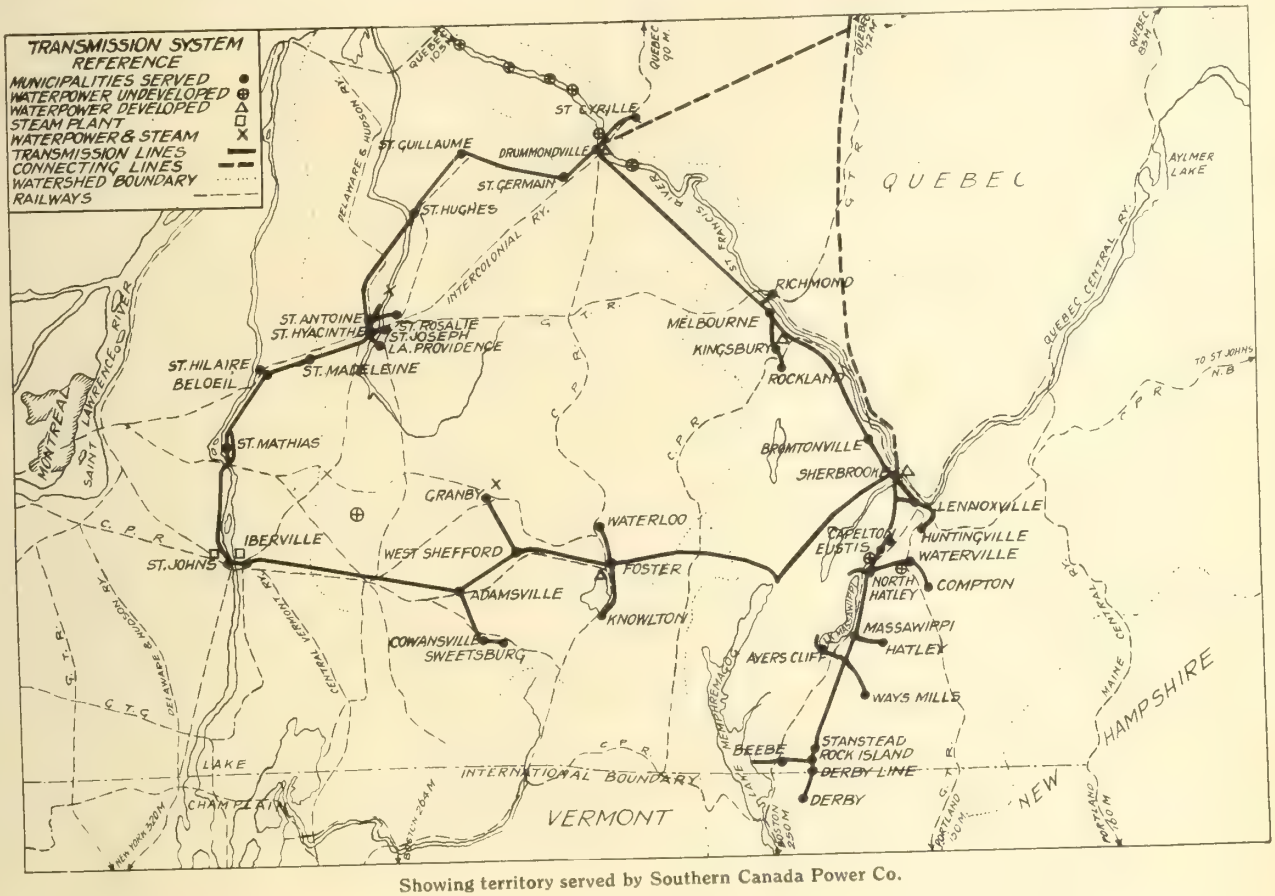
Rapid Growth of Southern Canada Power

Organized in 1913 They Have Developed Rapidly Until They Now Control the Development and Supply of Power Over a Wide Area

We have in previous issues emphasized the enormous growth in the demand for electric power in the Province of Quebec, due in a large measure to activity in industrial centres consequent on war conditions. On occasions this demand has threatened to exceed the supply, and has compelled considerable extensions to the plants. The Southern Canada Power Company, Ltd., serving a wide field in the Eastern Townships of Quebec and just over the border, has shared in this increased requirement for power. The company has shown a very rapid growth in the area it covers, and consequently in its earning power. From small beginnings in 1913 it has become an important factor in the power situation in the province, and, as it possesses some important undeveloped water-powers, it is likely to occupy a much stronger position in the near future. It is pretty generally recognized that Quebec, with its natural resources, has not yet attained anything like its ultimate standing in the matter of industrial development, and the possibilities of the Southern Canada Power Company must not be overlooked in summing up the general situation.

The area of the company's operations is approximately 100 miles east and west by 60 miles north and south. A glance at the accompanying map will indicate that the district is both industrial and agricultural, that it is exceptionally well served by railways, and that there are ample opportunities for development. At present the system is in the making, and it will necessarily be some time before the company will be able to realize to the full extent anything like the possibilities presented.

The company was organized in 1913 to acquire six water-powers on the St. Francis River, the St. John's Electric Light Company, La Cie de Gaz, Electricite et Pouvoir, St. Hyacinthe, and the municipal plant of the town of Drummondville. The water-powers are above and below Drummondville, and from Hemmings Falls, known as Power Site No. 1, to a point below the Moulin power, known as Power Site No. 6, the distance is 25 miles. These powers have been thoroughly investigated and reported on by Messrs. Viele, Blackwell, & Buck, of New York; the Stone & Webster Corporation, of Boston, Mass.; Mr. J. B. Woodyatt, the general manager of the company; Mr. J. M. Robertson, consulting engineer, Montreal; and Mr. W. I. Bishop, consulting hydraulic engineer, Montreal. The powers have a total head of about 300 feet, and are estimated to have a capacity of 90,000 h.p., 24-hour power, with storage to carry a peak of 150,000 h.p. Complete plans for the first two developments have been made, and a large amount of initial work done, so that the company is in a position to start at an early date on one or more of the powers.



Besides this the company has powers on the Yamaska River, at St. Cesaire, St. Hyacinthe, Granby, and Foster; on the Magog, at Sherbrooke; on the Coaticook River, at Waterville; on the Massawippi River, at North Hatley; on the Tomofobia, at Rock Island; and the Salmon River, at Kingsbury. Hydro-electric plants are in operation at Drummondville, St. Hyacinthe, Sherbrooke, Richmond, Foster, Granby, and Cowansville, with auxiliary steam plants at St. Hyacinthe, St. Johns, Iberville, and Granby. The company also purchases power from the Shawinigan Water and Power Company, at Sherbrooke, and from the Montreal Light, Heat, and Power Company at Richelieu.

It will be seen from the foregoing that since 1913 the company has considerably broadened its field. It now controls, in addition to the original charters, the South Shore Power and Paper Company, Ltd., the Brome Lake Electric Power Company, Richmond County Electric Company, Sherbrooke Railway and Power Company, Lennoxville Light and Power Company, Eastern Townships Electric Company, Stanstead Electric Light Company, Burroughs Falls Power Company, and the International Electric Company of Vermont. The most important recent acquisition was the Sherbrooke Railway and Power Company, which, in addition to giving transportation facilities with ten miles of rails, supplies one of the busiest industrial districts in the province with power.

The following is a list of towns and cities served by the company and its subsidiaries: St. Johns, Iberville, St. Mathias, Beloeil, St. Hilaire, St. Madeleine, St. Hyacinthe, St. Hugues, St. Joseph, St. Antoine, La Providence, St. Rosalie, Drummondville, St. Germain, St. Cyrille, Richmond, Mel-

bourne, Kingsbury, New Rockland, Waterloo, Foster, Knowlton, Cowansville, Sweetsburg, Granby, Bromptonville Sherbrooke, Lennoxville, Huntingville, Massawippi, Way's Mills, Boynton, Libbytown, North Hatley, Capelton, Compton, Eustis, Waterville, Rock Island, Stanstead, Beebe, Beebe Junction, Ayer's Cliff, Hatley, all in the Province of Quebec; Derby Line and Derby Centre, Vermont.

The plants, it will be noticed, are located over a wide area, and, in order to link up the system and to consolidate it with a view to economical operation, it has been necessary to construct 200 miles of transmission line, in addition to which 100 miles are being built or will have to be built. The lines are on wooden poles. The transmission is 25,000 and 50,000 v., and distribution 2,200 v., 3 phase, 60 cycle, a.c.

Showing territory served by Southern Canada Power Co.

An extensive program of improvements to the electrical plants and to the sub-stations has been carried out. New sub-stations have been built and others altered in order to meet the altered conditions. Outdoor sub-stations are the rule in small places, and the indoor type wherever it is necessary to employ a switchboard attendant.

The company has adopted a progressive policy in the matter of inducing the public to be liberal users of light and power. It has established 14 stores, at the principal points, at which it sells various electrical household appliances, motors, lamps, etc., also undertaking wiring work where the local facilities are limited. Recently a further step was taken in this direction—sites at St. Hyacinthe and Granby were acquired, and large and attractive showrooms constructed, in addition to offices for the staff. At Granby a portion of the site was used for the sub-station. The idea, in the establishment of these stores, is, of course, to instil in the public mind the advantages of both light and power for household and industrial purposes.

The earnings of the company and the subsidiaries have enormously increased, from $104,442 in 1914 to $432,634 in 1917; the profits have risen from $41,756 to $211,722; and the surplus from $7,936 to $47,347.

The officers and board of directors have been strengthened from time to time by the inclusion of technical and business men. The president is Mr. W. C. Hawkins, managing director of the Dominion Power and Transmission Company, Hamilton, Ont.; the vice-president is Mr. F. W. Teele, formerly general manager of the Porto Rico Railways Company, Trinidad Electric Railway, Demerara Electric Company, etc.; Mr. J. B. Woodyatt, the general manager, and Mr. L. C. Haskell, the secretary-treasurer and purchasing agent, have been associated with the company from its inception. The directors are: Messrs. W. K. Baldwin, M.P., Baldwin's Mills, P.Q.; H. T. Chalifoux, St. Hyacinthe, P.Q.; James Davidson, Montreal; L. C. Haskell, Montreal; W. C. Hawkins, Hamilton, Ont.; C. J. McCuaig, Montreal; W. H. Miner, Granby, P.Q.; Lieut.-Col. J. R. Moodie, Hamilton, Ont.; Messrs. A. J. Nesbitt, Montreal; George Parent, K.C., M.P., Quebec; Charles E. Read, Ottawa, Ont.; J. M. Robertson, Montreal; F. W. Teele, Montreal; C. W. Tooke, Syracuse, N.Y., and J. B. Woodyatt, Montreal.

The head office is in the Coristine Building, Montreal.

The first electric furnace of the inductive type to be erected in South Africa was set up a few months ago by the Witwatersrand Co-Operative Smelting Works, under the auspices of the Chamber of Mines, for making steel castings, such as shoes and dies, for the mines from scrap metal. The British Trade Commissioner reports that between 70 and 80 tons of shoes and dies are now being turned out per month by this furnace, which is contributing very materially to requirements. The lining of the furnace at first presented some difficulties, but these were solved by the use of magnesite from Eastern Transvaal, calcined in Johannesburg. Two linings per month are required.

How the Power Conservation Order is Being Kept in Ontario

With very few exceptions, the light and power users of Ontario have loyally responded to the appeal, or order, of the power controller to conserve every possible watt of electric energy, to the end that it may be utilized more extensively in the manufacture of munitions of war. That the need is urgent is fully realized by everyone, and, from opinions gathered here and there, large power users are more than ready to curtail their demands, even to the extent of crippling their business and industries. It must be seen to, in every town and city, that all users comply fully with the order, for where less patriotic authorities ignore the rules laid down and their action is allowed to go unchecked, it will have a tendency to discourage the more considerate consumers. In one or two cases notice to the effect that the entire service would be cut off unless the rules were observed sufficed to bring certain offenders to a proper realization of the situation.

As instances of the extreme shortage existing among munition manufacturers, the American Cyanamid Company of Niagara Falls, which makes ammonia for use in the manufacture of high explosives, reported recently a 15,000 h.p. shortage in their usual power supply and the consequent curtailment of their output. The Union Carbide Company and the Electro Metals Company, two Welland concerns making war supplies, each reported about 15,000 h.p. short also.

Possibly the cutting off of even a small block of power is keenly felt by some of the smaller manufacturers not engaged on munition work, but among those using large quantities of energy it has been found that, by making slight alterations in the layout of shafting and machinery, it is often possible to take two, three, or four motors off the load.

In the matter of store lighting the majority of merchants are co-operating to the fullest extent. In St. Thomas the local hydro commission threatened to discontinue the service of a few stores disobeying the order. An appeal was made to all power users, with the exception of munition plants, and many responded by shutting down their factories half an hour earlier in the evening, in addition to cutting off motors wherever possible. It is estimated that the load in this city has been reduced almost 50 per cent. Some typical examples follow:

In Welland the street lighting has been reduced by 50 per cent., and all electric signs have been cut off. An urgent request has also been made to all power users to cut down their demand as much as possible.

In Galt a meeting of the large power users was held, and promises readily obtained to either reduce their loads or stop plants altogether on request. The total load in this city is 2,681 h.p., and an endeavor is being made to reduce it by 25 per cent. Several of the larger users stated that, by rearranging their machinery, many motors could be taken off the load. A table is being prepared by the local hydro commissioners, so that manufacturers will be in a better position to regulate the time of their maximum demands. On streets where there are single light standards all lights on one side of the street have been cut off, and where there are cluster lights two lights on each have been taken off.

The Hurlbut Shoe Company, of Preston, shortened their working day to five hours when requested to do so by the local commission. The manufacturers in this district have willingly been doing all in their power to conserve electric energy.

The Stamford Township Council decided to cut off all street lighting in the township until at least February 15, and in Niagara Falls all verandah and ornamental lights of all kinds have been cut off. It is proposed also to turn off street lighting at midnight.

In addition to the observance of other rules, the street car service in Guelph was discontinued except for an hour at noon and at nights.

The permitted peak load in Kitchener is 4,800 h.p. but the local commission have kept it under 4,500 h.p. with the co-operation of manufacturers. Street lights are not turned on until 6.15, and the rules regarding electric signs and display lighting are being enforced.

Chatham street lights are not turned on until 7 o'clock, and restrictions in store and sign lighting are being enforced. The city's maximum load of 1,000 h.p. has been reduced from 15 to 25 per cent. in the peak load hours.

Mayor Weaver, of Hespeler, stated it would be impossible to further reduce their load, as they already had it down to the limit.

The light commissioners of St. Catharines ordered that each alternate 100 watt lamp on the street lighting system be removed and that all 200 watt street lamps be replaced by 100 watt lamps.

The London and Lake Erie Railway Company cancelled their Sunday service and reduced the week-day schedule, bespeaking the indulgence of their patrons on the grounds of patriotic duty.

The Ontario Hydro-Electric Commission notified the Brantford Municipal Board of Street Railway Commissioners to reduce their load by 25 per cent., and, in accordance with this order, the car service was reduced from a ten to fifteen-minute service on the main line and a twenty-minute service on the line to Eagle Place. The running time is also much slower. Other retrenchments have also been made in street and sign lighting.

The Town Council of Petrolea, Ont., received notice from Hydro headquarters that from 7 a.m. to 9 a.m. only 85 per cent. of the maximum load of 300 h.p. was to be used; from 9 a.m. to 4 p.m., 75 per cent.; from 4 p.m. to 6 p.m., 85 per cent., and from 6 p.m. until 7 a.m., no restriction. Street lighting is not turned on until 7 p.m. Local power users were waited upon and arrangements made to comply with this schedule.

It is expected that about 3,000 h.p. will be conserved in Hamilton by the various recommended means. On January 15 all electric signs, display boards, show windows, and other electrical devices for advertising wares were turned off and each alternate cluster light in the down-town section has been taken off. Very few violations of the new rules are reported, and these are generally due to misunderstandings.

In Ingersoll the order was received to keep the load under 860 h.p., and men were sent out from the sub-station to request the local merchants and factories to shut off every unnecessary lamp and motor. As an instance of the steps taken in this town to comply with the order it was necessary on one occasion to shut off all the small motors in town about 2 o'clock in the afternoon. Between 5 and 6, in order to still further reduce the load, it was found advisable to shut off the stores and residences as far as possible. The Ingersoll Machine Company use the bulk of the power, and stores and residences will be shut off in order to keep this plant going.

Street lighting in Brockville has been so adjusted that in cases where five and three lights form a cluster only one lamp is permitted to burn. On other streets every alternate light has been taken off. Recently the lights on residential streets were turned off on moonlight nights, but the experiment was not entirely successful.

Probably one of the most strenuous objections to the new order comes from Tillsonburg, and a delegation was sent to Toronto to register a protest. On January 21 it was reported that the town was facing a serious water famine and probable

serious loss to manufacturers by reason of a twenty-minute notice given to the Tillsonburg Waterworks Company to shut off their electric pumps. The company have auxiliary steam power, but, of course ,their coal supply is inadequate.

On the main thoroughfares in Toronto every alternate cluster light is dark, and on the residential streets every unnecessary light has been turned off. The set rule in this regard is to turn out every alternate light, excepting in certain locations where good illumination is essential to public safety—in the vicinity of fire alarm boxes, on dangerous corners, etc. No single light standards on the car line streets have been turned out, owing to the possibility of traffic accidents. A suggestion to turn off the lights in the civic skating rinks and the various parks will not likely be carried out. It has been pointed out that the majority of these lights are not turned on until 7 o'clock. The down-town merchants have readily responded to the appeal to cut off window lighting at night, and Toronto's "White Way," which has been, on a smaller scale, a close rival to Broadway, New York, presents an entirely altered appearance.

Power Plant Carried by Latest Type of German Aeroplane

The Electrical Review prints an interesting article translated from La Nature of recent date, describing equipment carried by German aeroplanes for signalling purposes. It is understood that on account of noise messages cannot be be received—only transmitted.

The transmitting station on the latest type of German aeroplane consists of:—

1. A generator of d.c. and a.c.
2. The oscillating circuit.
3. The antenna.

1. At first the necessary current was provided by a storage battery. Difficulties arose, however; the batteries were very heavy, very fragile, and liable to be discharged rapidly. Small a.c. and d.c. generators were then fitted. These generators are driven by an air screw, or are coupled to the aero motor by a coupling (clutch) operated by the pilot. The generating plant, styled "J. A. Flieg, 1917," by the Germans, comprises two generators mounted on the same shaft. One of these, forming a simple dynamo, supplies the d.c., and is used for exciting the alternator, for the oscillator circuit, and probably also for lighting the lamps and projectors on the aeroplane.

The other generator supplies the a.c. for the oscillating circuit.

The three types of transmitter actually employed are the "Sender" type C, 1916, the "Huth transmitter," and the "Telefunken transmitter."

Underneath the alternator is a sort of case, into which 12 terminals lead. These terminals permit of inserting in the exciting circuit different values of a resistance placed in series, and housed under the generator.

According to the type of transmitter fitted on the aeroplane, these terminals are used with the corresponding types of current. For check purposes they are connected up by connecting plates corresponding to the transmitter employed, the connectors being small plates of insulating material.

In the cover of the case mentioned above is a small transparent window for observing whether the generator is properly regulated in respect of its oscillating circuit. The generators are constructed so as to work rotating either right or left, according as they are driven by air screws or by the aero engine. The type of generating set just described weighs, with its air screw, cables, etc., 10.3 kilograms (about 23 lbs.). The driving screw is designed to give a speed of 4,500 r.p.m. with a wind speed of 150 km. (say 90 miles per hour). Variations of aeroplane speed do not appreciably affect the output of the generating set. The set is air-cooled.

Transmitting Apparatus

The "Telefunken" apparatus comprises the usual parts, the whole being contained in a case measuring about 14 in. x 10 in. x 6 in., and weighing some 19 lbs. These parts are: a transformer, a condenser, a plate-type spark gap, and a variometer. There is a three-stud contact device for varying the intensity of emission by a rheostat in the excitation circuit, and at the same time decreasing the resistance of the spark-gap by short-circuiting part of the plates.

Another three-stud contact permits of employing three different wave lengths, viz., 150, 200 and 250 metres, by using one or more turns of an Oudin coil. The variometer (variable self-inductance) permits of tuning the aerial with the primary circuit. The observer knows that his circuit is properly regulated when the ammeter pointer attains a maximum.

The transmitting aerial is formed by a 1-mm. diameter copper cable about 40 metres long. This wire, which hangs below the aeroplane, tends to assume a nearly horizontal position by reason of its inertia and the wind resistance.

A special arrangement is provided for preventing the antenna swaying, and for ensuring that the correct length is unwound. The manipulator and ammeter are of the usual type. The conductors of this system are insulated and mounted in special flexible aluminium tubes.

The total weight of the complete set is as follows:—

Oscillatory circuit	8.7 kg.
Generator system	10.3 kg.
Aerial, etc.	3.7 kg.
Manipulator, wiring, and ammeter	3.0 kg.
	25.7 kg.

or, say, ½ cwt.

The mean range of the set seems to be about 35 kilometres, or something over 20 miles.

Every squadron of the German Army Service Corps attached to the air service includes a tractor wagon specially fitted up for dealing with repairs to, and tests on, wireless sets.

The Future of the Engineer—A Winnipeg Engineer's Views

Winnipeg, January 11th, 1918.

Editor, Electrical News:—

I have read with great interest in your issue of December 1st, the article entitled "The Future Place of the Engineer," and I have also read with further interest in your issue of January 1st, the classification of the new members of the Canadian Parliament, and it is particularly interesting to note that the engineers as a profession are not represented.

Your article in the January 1st issue, showing that no engineers are in the Canadian Parliament is one that should give all engineers that are proud of their profession and interested in the welfare of their country, food for thought. Much has been written and much has been spoken on the status of the engineer, the engineer's responsibility to society, and the education of the engineer, but how seldom do we see anything on the subject of the engineer's place in the legislative halls of his country. It has been said by many engineers that to feel that they are producers and constructors is sufficient reward in itself. That may be a very laudable

thought from the moral point of view, but in these days of stress and strain, the engineers as a body ought to realize that the very training that they have been fortunate enough to attain should put them in the forefront of all professional men, that they should be leaders of thought, leaders of public initiative, and help advance legislative conditions in the country in which they live.

Two of the greatest factors in the advancement of civilization today are light and transportation, both the product of the engineer, and still the very thought that engineers may not care whether they get the credit for the above or not is the very fact that their work has resulted in better conditions for humanity; but they must urge themselves to still further ambition in that they give wherever possible their time to the study and solving of some of the great questions in front of our legislative bodies today. What class of men are more fit for public life than engineers? The very fact that they deal with the stupendous forces of nature makes them inherently honest, one factor so essential to public life.

Engineers are modest to a degree, and unfortunately, often timid, when it comes to pushing themselves in the limelight, though this timidity may be due to a certain extent that as a body they cannot be accused of being public speakers; they should endeavor to cultivate this very necessary adjunct for public service, when they would undoubtedly feel in a better position to take their place on the public platform.

One of the reasons that lawyers and physicians have a certain status in the community is because they have interested themselves in public service, and to their profession has come a certain amount of honor that successful and honest public service should, and does bring, to the server.

Engineers having been backward in public service in the past—and when I say public service I mean some administrative position in public life—they are often put in a position where they appear to the general public as being lower on the professional ladder than the other professions.

For instance, a consulting engineer may be asked to make a report on some engineering or financial question for a certain town, and he is asked to appear before the corporate body of that town, present his report and possibly discuss same. On that corporate body may be the local butcher, baker and doctor, and almost invariably the local lawyer. The baker and the butcher defer more or less to the opinion of the doctor and the lawyer, and the two latter are generally looked on to decide as to whether the engineer's report meets with the requirements of the community or not.

Time and time again this has happened, engineers all over the country have had the same experience, and though the engineer may think he is doing the best he can for his country by making honest and correct reports, he would be doing a greater service for his country were he able occasionally to take his place in the legislative bodies that control civic, provincial and Dominion affairs.

I understand that the Canadian Society of Civil Engineers is endeavoring to stir up some interest in these matters, and the men behind this movement deserve every encouragement and help from their brothers in the profession, as undoubtedly by the engineer taking a greater interest in public affairs he will not only be doing something for the betterment of his country, but also for the betterment of his profession, and therefore himself.

True, sacrifices have to be made, and especially in the case of consulting engineers, who are in business for themselves, and have no large organization to carry on their work in their absence, but if ever the time has arrived for engineers to start and blaze the trail of placing their services as public servants before the electors, that time is present. Some engineers may say we can make more money by selling our services as engineers and not as public servants, but I submit that the status of the profession, and hence its monetary value to ourselves, will be raised if we take our place with other professions and let the public decide as to whether they would like us as some of their leaders of public thought.

What type of men more fit for the positions of Minister of Public Works, Minister of the Interior, Minister of Mines and Minister of Railways and Canals than engineers, and yet almost invariably these positions are filled by lawyers.

One reason that lawyers and physicians have been able to push themselves into public life is that they have tried to train themselves to be familiar with subjects outside of their own professions, and when they meet together they do not always discuss their own profession, or rather technical problems of their own profession, a habit that engineers are very prone to.

Art, literature, music, geography, history, finance and political economy deserve more than passing thought from every man, and to the engineer who wishes to be broad in his aspect these subjects are just as important as stresses and strains, reforestration and mathematics, and, above all things, a proper realization of the personal equation of those with whom you deal is a very essential factor to success, and is just as important to the engineer as to the doctor or the lawyer.

The engineer, more than all other men has it in his power to create a new era of real public service and to guide humanity. On the engineer, and such men who train engineers, rests a responsibility such as not many professions have been called upon before to face, and especially so as because upon us rests the responsibility of conscious knowledge of this fact.

In all matters pertaining to the war, engineers have done Trojan service. In fact in no small degree will it be the engineer who will be responsible ultimately for the destruction of that terrible and tragic ideal created by the common enemy, who the allies are endeavoring to crush. With the conclusion of the war a new world will arise, and the engineer must wake up and take his place alongside of the men of other professions and help create a better democracy at home, and this he can do by taking his just share in the public life of this great and wonderful Dominion of Canada.

May I take this opportunity of congratulating you on the stand you are taking in your paper regarding these questions.

Yours very truly,
Charles F. Gray,
Consulting Electrical Engineer.

Government Takes Over Niagara Power Plants

On December 28 the United States Government requisitioned the electric power produced, imported and distributed by the Niagara Falls Power Company, the Hydraulic Power Company of Niagara Falls and the Cliff Electrical Distributing Company. Disposition of the power and rules regarding its use will follow an investigation of the power and fuel situation in and around Buffalo by Robert J. Bulkeley, who is connected with the War Industries Board, and Col. C. Keller, U. S. Army, of the Chief of Engineers' Office in Washington.

The Main Electric Manufacturing Company have just issued their catalogue No. 100, which supersedes all previous issues, and is a complete catalogue of Main electric lighting plants for the farm. A copy will be supplied on request to the company.

The Dealer and Contractor

Get Rid of Your Dead Stock—It Does Not Pay to Hold Even if Prices are Going Up—Good Business Requires Up-to-the-minute Supplies*

There has never been a time when it was more opportune to move any dead stock that the electrical dealer and contractor has on hand than the present. In many instances it has been the practice of the central stations to sell appliances at prices which would not leave the dealer and contractor enough profit to enable him to compete with them. This day, however, has passed, probably never to return again.

To-day the price of coal, labor and everything else that enters into the cost of generating and distributing electricity have all increased. At the same time the demand for current has increased to such an extent that it is straining the capacity of the individual companies to meet the demand. These two facts remove the temptation to sell appliances for less than cost or at so small a margin as to monopolize the business with the end in view that the introduction of these appliances will increase the current consumption.

This condition of affairs is making it possible for the independent dealers and contractors to secure a great deal of business that otherwise would be beyond their reach. Most important of all, however, it is probable that never again will it be the general practice of central stations to sell appliances at a price which does not allow a fair margin of profit. Before this war is over there will be a great deal more attention called to this phase of the central station business than it has ever received before.

New Opportunities

With the cleaning up and revising of central station merchandising methods there will arise new and wonderful opportunities for the dealer and the contractor. Each of them will be able to expand his business in a way and to an extent that he has never been able to before. To prepare for this new era, however, it is necessary to clean up all the dead stock, the stock that one might be tempted to hold for higher prices. It is necessary to clean this up now, to sell all of it at once.

One of the complaints that central stations have made against dealers and contractors is that they do not go after business hard enough. They have claimed that if the central stations did not sell appliances they would lose much in the way of electric current sales. Possibly one reason why so few appliances have been sold in the past is because these dealers and contractors have not kept their stores as neat and attractive as have been the stores of the central stations.

You may reply that no dealer or contractor can go to the expense that the central station has gone in this respect. This statement is true, but it is not necessary to go to great expense to look neat and attractive. Few people refuse to wash their face and hands because they cannot afford to buy perfumed soap. It's not, after all, the expense that has been incurred so much as the thoroughness with which the work is done.

I have in mind the stores of two dealers. One is filled with old dirty stock. The whole establishment is far from attractive though it is housed in a substantial building and one which could be made to appear very attractive with clean, fresh stock and clean fixtures. The other store is housed in a smaller and a cheaper building but it is kept clean and the stock is all fresh and new. None of the stock in this store is allowed to die. It is all sold. There is nothing expensive about it but everything is attractive. Little things like fresh crepe paper are used to lend charm to the cheap tables and counters, show cases, etc., on which the goods are displayed.

Keep the Stock Moving

One of the reasons given for the success of large department stores and chain stores is that they very rarely have any dead stock. Some of these stores place tags on their goods which indicate to the salesman just how long it has been placed in stock, a blue tag may mean that it has been in stock for a month, a yellow tag that it has been in stock for two months, a pink tag that it has been in stock for three months and a red tag that it has been in stock for four months and must be sold at once. Each time a tag of a different color is placed on the goods the price is reduced and in all probability the price on the red tag is lower than the amount actually paid for the goods. However, it proves more profitable to sell them at a loss than to have the money tied up. The money working will soon earn the amount lost but the money idle will eventually lead to bankruptcy.

Let us take a concrete example. Suppose you have an article in stock that cost you $9.00 and that it is a good seller so you retail it for $10.00. Suppose that, due to the constantly increasing cost of raw material and labor, the retail price of this article advances 50 cents per month. In a year it will have increased in price $6.00. In other words, by simply allowing it to lie idle for a year a profit of $6.00 has been made on it. Surely it would pay to let stock become shelf warmers if the price was constantly increasing like this. Many a small dealer has been able to undersell the city department stores on certain commodities he had in stock for several months and at the same time make a profit for himself because of the difference in the methods of the large and the small retailers and due to the fact that retail prices have been climbing rapidly during the past two years. It would seem, then, that the retailer who has saved his stock has the advantage.

Let us go back and examine the case of the article which at the beginning of the year cost $9.00 and at the end of the year sold for $16.00, thus, by simply lying idle, showing a profit to the dealer of $6.00. Suppose that, instead of keeping that article in stock he had sold one a month at a profit of only $1.00. It would not require any more capital to do so than to hold the original one in stock for the money

* By J. E. Bullard in National Electrical Contractor.

received from the first one would buy the second, the money for the second one, the third, and so on to the end. The annual profit would have been $12.00, however, instead of only $6.00, and at the end of the year the stock would be fresh and attractive. The profit would also be in hand and not on the shelf, as in the case of the stock that had been held for a year.

Dangerous To Tie Up Money

It is easier to see that the stock ought to be turned as rapidly as possible to avoid loss when the retail prices are decreasing, but there is a tendency to hold on to stock when the retail prices are ascending, in the hope that the longer it is held the greater will be the profit. This feeling is preventing many a man from realizing upon the present market. He is still waiting for better prices rather than sell all his old stock now and turn it into money. No one knows how long conditions will exist as they are. All the big establishments, doing a retail business, however, do know that this is no time to hoard stock. They know that it is just as dangerous to tie up a lot of money in dead stock now as it is at any other time, and they are keeping their stocks moving.

No dealer can expect to compete for the best business until he realizes this fact. The mere act of clearing out all his old stock, some of which may have been on hand for years, and turning it into money now will help increase his business. He will be able to offer bargains in goods that are in perfect operating condition that will prove very attractive to many people. If he will follow up this clearing up sale with good fresh stock that is carefully purchased and is sold to the last article within a few months, even if it must be sold at a slight sacrifice, he will find that at the end of the year his profits on appliance sales have been greater than they have ever been before.

Now is the time to develop this business. As has already been stated, the central stations are not so likely to take as keen an interest in the sale of appliances as they would during normal times. On the other hand, the difficulty in securing coal is going to make many people use more electrical appliances than would otherwise have been the case. There will be a tremendous demand built up for electric ranges and other heating devices that would not exist if every household could without difficulty secure all the coal that it desired.

What Not to Do in Advertising—Some Warnings the Dealer Will Profit by, if He Heeds

A short time ago Mr. J. C. McQuiston, publicity manager Westinghouse Electric & Manufacturing Company, was asked by a prominent manufacturers' association to give them some points on advertising. Mr. McQuiston put his reply in the form of Don'ts," some of which are very much to the point. Here is what he said in part:

Don'ts in Advertising

Don't fail to advertise if you have something to advertise.

Don't advertise just because someone else in the same line does.

Don't leave the copy to the office boy's aunt. She can knit better than she can write advertising lines.

Don't forget that advertising is a part of selling—and selling is no joke.

Don't make statements that you cannot support in practice.

Don't make invidious comparisons.

Don't try to put a full page of copy in a quarter page space. Better put a quarter page of copy in a full page of space.

Don't fail to give your firm name in the same way—same type—and your address always.

Don't print a circular and then wonder what to with it. Study your market and as you do so, write your appea direct to the market. "From Kalamazoo direct to you."

Don't overlook the direct appeal to a customer. Don' fail to talk to your prospects in your circular letter, or othe correspondence, as you would talk to them face to face. B natural.

Don't forget to follow up your advertising.

Don't use all the type styles—rather have one dominating style and stick to it.

Don't pick a thin, skinny type—but one that has a bold courageous face—typical of strong and dependable business.

Don't give more than one bright idea in an advertisement. To do so may endanger your future stock.

Don't express in words what a picture can portray—use illustrations.

Don't run the same advertisement all the time. Change of copy makes your advertisements of continuous interest.

Don't buy space to please a solicitor. If you do, he will be the sole beneficiary.

Don't overlook the trademark. If you do not have one, make one, and show it in every ad. Also put it on stationery and all apparatus.

Don't be a spasmodic advertiser. It is the constant dripping of water that wears away the stone.

Don't advertise in one-time schemes, special issues, etc., and expect business in return.

Don't expect to be always able to check definite results. If you have no faith you had better leave advertising alone.

Don't overlook good will in your business, and the fact that you can make your advertising create good will.

Don't make your appeals in the negative, as "You don't want this," or "You don't want that." The phrasing should be positive and strong, as "You do need this," and "You do need that."

You should also avoid interrogation if you would make your appeals strong. For example, "Do you not think that it would be well to do this?" "Will you not stop to consider?" The appeal should be positive and direct. "Stop to consider." "Of course you think it would be well to do this or that." Imagine someone approaching you to sell some tickets to a charity supper and using such an appeal as "You don't want to buy a ticket for this or that." Think how easy it is to say "No." Think, on the other hand, how much easier it is to get the response "Yes" when you say, "Of course you want to help out this or that charity by buying a ticket to this or that supper." The "Yes" is almost as sure to come as the "No," when the right presentation is used.

Don't think because you know your business that you can also be a top-notcher advertiser. The wise business men call in advertising specialists to prepare their advertisements, just as they retain attorneys to keep them out of lawsuits, and patent lawyers to protect their patent rights.

Finally, don't forget that advertising should portray the sort of a business house yours is. If your advertising be ever so good—indicating order, soundness of credit, promptness of delivery of goods, quality of product—and then in all or some of these things your practice falls short of your claims, the advertising stands out as a glittering lie. Therefore you should strive just as earnestly to prove your claim in business practice as to announce them in printers' type.

Notice was mailed under date January 15, 1918, by George D. Leacock, sales manager, that the Moloney Electric Company of Canada, Limited, have opened a branch office and warehouse at Halifax, N.S., for the Maritime Provinces. Mr. E. A. Scath has been transferred to Halifax from the Montreal office and will have charge of this territory.

Quebec Province Will License Electrical Contractors—Bill to be Introduced at next Session

Electrical contractors in the Province of Quebec will be interested in a bill which is to be introduced by the Hon. L. A. Taschereau, Provincial Minister of Public Works and Labor, with a view to greater protection of public buildings from fire. The bill will compel the licensing of persons and firms installing wiring, electric lighting, and heating systems, the licenses to be issued by the provincial government. Such a regulation will involve examinations to determine the competency of those requiring licenses. Apparently the idea is that fires are often caused by defective work in wiring, etc., and that certificates of competency will make for more efficient sub-contractors and workmen, and thus for the better protection from fire.

At present there is no system of licensing, compulsory or otherwise, the inspection of wiring, etc., devolving on the electrical inspection department of the Canadian Fire Underwriters' Association, with the head office in Montreal. The inspection of public buildings and residences is supervised by the department, under an arrangement with the fire insurance companies and with the lighting and power companies, and also, in two or three instances, under municipal by-laws. The department covers all the more important places in the province. By the provincial building laws, it is provided that, at the direction of the government inspector, a certificate of the underwriters' bureau must be produced in the case of moving picture houses and theatres.

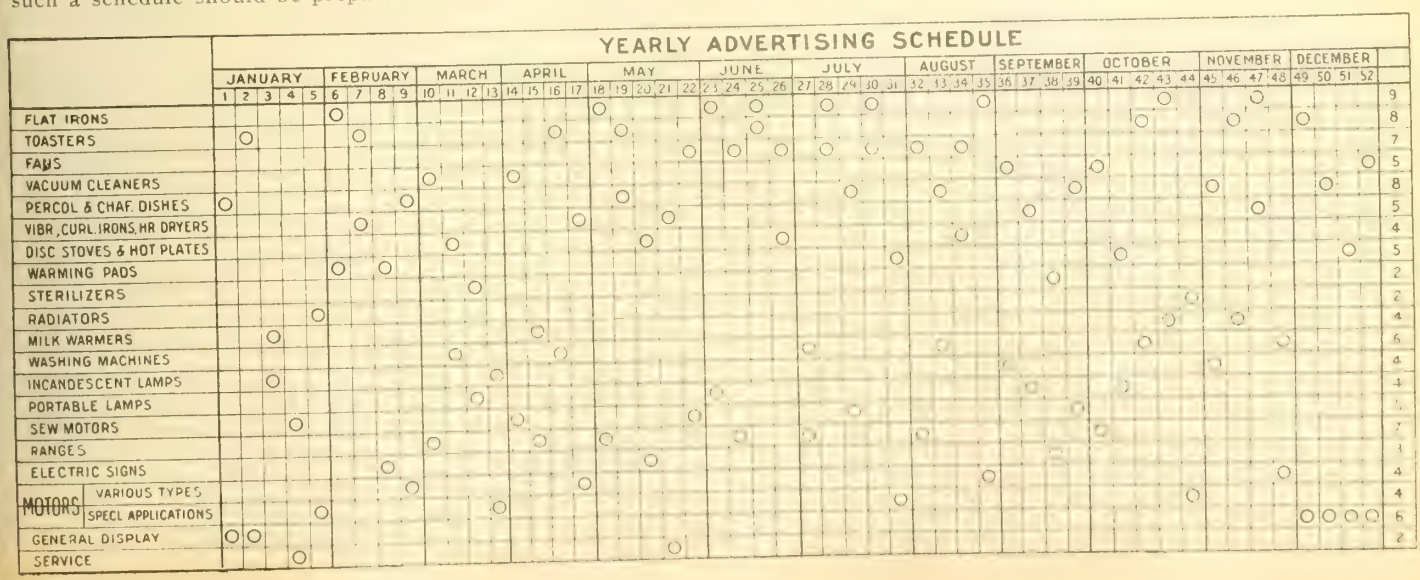
It is possible, under the present arrangement, for alterations to be made to residences without the knowledge of the insurance companies, although in the case of public buildings the periodical inspections constitute a safeguard against this sort of thing.

Many of the substantial contracting firms have advocated the compulsory licensing of contractors and workmen as the only method by which competent men can be trained, and also by which incompetent men can be barred from starting in business. Any wireman, with only the most elementary knowledge, can now set up as an electrical contractor, with the result of poor work and of ruthless cutting of prices.

A Yearly Sales Schedule for the Man Who Looks Ahead and Plans Accordingly

The Westinghouse Company recently compiled the sample yearly schedule reproduced below, for the guidance of retailers of electrical appliances. The underlying idea is that such a schedule should be prepared for the whole year, well in advance, and that it should govern the efforts of the retailer at the various seasons of the year. Special attention has been paid to two general principles, (1) that there is one or more seasons in the year in which each individual item is more saleable than at any other time, and, (2) that every item of merchandise should receive its just share of sales effort.

This schedule does not necessarily mean that these items must be advertised extensively; that will depend on the dealer's own judgment. It does mean, however, that the dealer knows in advance what he is going to concentrate his attention on next. It means that for the day or week, as the case may be, he makes a special drive on one particular line. At least this item will form the basis of his window display. If he advertises in the local papers it will be the special feature. In addition he will display it prominently in his store and, possibly, offer some inducement to increase his sales in that particular article. For example, a customer may come in to buy an iron but, seeing a special display of toasters, may be attracted to purchase one of them also.



Even if the plan does nothing more than lead the dealer to plan "ahead" and carry on his merchandising systematically, the preparation of such a schedule is well worth the effort.

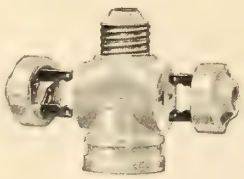
Toronto Electrical Contractors Hold Successful January Meeting

The regular monthly meeting of the Toronto Electrical Contractors' Association was held on January 10. About fifty members attended the dinner and this number was considerably augmented during the evening. As previously announced, it was a sort of "Members' Night," the main program taking the form of a description of original ideas and ways of overcoming difficulties met with by members in the ordinary pursuit of their business. A number of very helpful ideas were brought to light, from a description by Mr. Rooke of his latest form of switch box to Mr. Davenport's explanation of the use of vinegar in loosening corroded nuts, screws, etc.

The February meeting will be held on Thursday, February 7, when Mr. Beach will explain to the members a simple method of accounting, suitable for the needs of a majority of the members.

Don't forget the date of the meeting—February 7th; or the place—the Carls-Rite; or the hour—7.30 sharp. A proper system of accounting may easily save any member the price of his association expenses many times over.

Geyser Electric Washing Machine

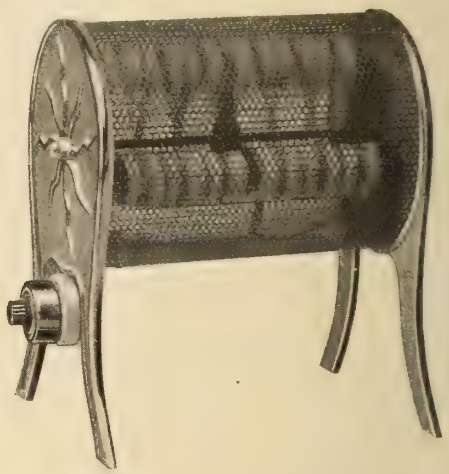


The illustration herewith shows the "Geyser" electric household machine manufactured by the Onward Manufacturing Company, of Kitchener, Ont. The principle of this machine is that, by means of a high speed propeller in the bottom of the tank, hot suds are forced through the clothes which are contained in a constantly revolving cylinder. It

is claimed by the manufacturers to be very compact, simple in construction, light weight, noiseless in operation and attractive in appearance. Above all, it is said to wash the clothes absolutely clean without any wear on the clothes. The washer is made in three sizes, with swinging or stationary wringer.

Hubbell Current Tap

The convenience of the current tap used in connection with socket outlets is becoming so fully recognized that Harvey Hubbell, Inc., are supplementing their standard single outlet current tap with a new one providing two plug outlets



in addition to the lamp outlet. This device is constructed throughout of porcelain, is fitted with shade holder groove and slots so designed as to accommodate any one of their different styles of interchangeable plug caps. The new device is known as current tap No. 6553.

A new catalogue, No. 47901, has just been distributed by the Canadian General Electric Company, on Sprague panel boards and cabinets. This catalogue is 70 pages of 8 in. by 10 in. size, giving in most complete form all data and information necessary for panel boards.

The Crouse-Hinds Company of Canada, Limited, have issued an illustrated folder entitled "Condulet Suggestion No. 1." This will be followed by others of the same series.

Superior Electrics

As recently announced, a new manufacturing concern operating under the name "Superior Electrics" has commenced operations in Pembroke, Ont. Electric household appliances of various kinds will be placed on the market to be added to as business conditions demand. Already such every-day devices as irons, toasters, toaster-stoves and heaters are on sale. Mr. Charles E. Breckenridge, formerly of the Renfrew Electric Company, is managing director and thus brings to bear a wide experience in the management

of this particular line of business. The heater illustrated herewith is one of their several lines that have already established themselves.

Hart Accumulator Company Have a Bumper Year

The Canadian Hart Accumulator Company, Limited, St. Johns, P.Q., report a very successful year during 1917. In their Stationary Battery Department the works have been on overtime most of the year, carrying out orders for large batteries for submarines, transports, wireless stations, telephone exchanges and town lighting. The Train Lighting Department has also had a most successful year, having obtained orders from the C. P. R. and G. T. R. for electric lighting equipments for their dining cars, sleepers, etc. The greatest advance, however, has been made in the Automobile Self-Starting and Lighting Battery Department. Mr. Geo. Archdeacon, A.M.I.E.E., general manager of the company, has given special attention to developing the M. S. L. Battery, and has concentrated on its production. He reports that his labors in this direction have resulted in a most gratifying success, as during the 1917 season over 3,000 batteries were sold throughout the Dominion. The company state that their strong card is "Deliveries," as they can make shipment within 30 minutes of receipt of order.

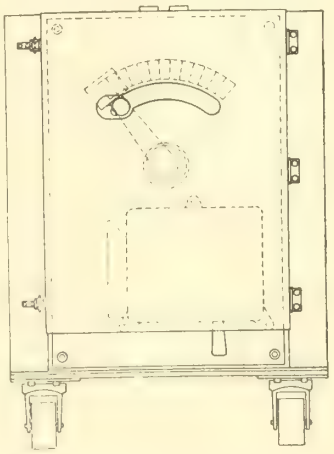
Automatic Electric Iron

An electric iron equipped with a switch which opens automatically when the iron is not in use, is announced by a United States manufacturer. A switch button is located in the forward part of the handle, just where the thumb ordinarily rests. Under normal ironing conditions, the thumb presses against the switch button and keeps the iron in circuit; removing the thumb cuts it out of circuit. By means of this switch button, the current may be cut in and cut out at will by the operator, merely by moving the thumb. This will be found convenient when ironing lighter fabrics, the heat being shut off when not needed to prevent scorching.

Fans—The Robbins & Myers Company are distributing Catalogue No. 1117, dated January 1, 1918, describing and illustrating their line of non-oscillating, oscillating, ceiling and ventilating fans and hat cleaning motors.

A High Voltage Series Relay

The Canadian General Electric Company has recently made several improvements in its high voltage series relay used for the automatic tripping of oil circuit breakers. As illustrated, the mechanism of the relay consists of two main elements, joined by a wooden rod. The upper element—solenoid, counterbalancing weight, and a mechanism for transmitting the motion of the solenoid plunger to the operating rod—is mounted on a high-tension insulator and isolated from ground. The lower element—relay contacts, cover for contacts, calibrating parts—and time limit arrangement when



used—is mounted below the upper element. The solenoid is connected in series with the circuit, and one end of the coil is electrically connected to the solenoid frame to avoid static stresses. The solenoid coil and mechanism do not require adjustment after installation, and thus are not a source of danger to the attendants. When the solenoid or relay operates, the motion of the plunger is transmitted through the wooden operating rod to a set of double-break switch contacts which close when the solenoid plunger rises because of overload or short circuit and open again by the weight of the plunger when these abnormal conditions are removed. The oil circuit breaker tripping circuits are the same as when the more common secondary relays are used with circuit closing contacts. The current adjustments and the time delay setting are made at the lower end of the operating rod, and of course in safety to the operators. The relay is calibrated from normal to three times normal current. Current calibration is made by the sliding weight. Time delay adjustment is made by an oil dash pot shown. When instantaneous operation of the relay is desired, the time delay features are omitted. Contacts, mechanism, solenoids are the same for all voltages—that is, from 15,000 upward—but the coils vary in capacity according to the normal ampere capacity of the line. The insulators for mounting the solenoid will vary according to the line voltage and the factor of safety required.

Portable Outlet Panels for Electric Welding Service

For an electric welding outfit to be of its maximum service it must be so arranged that it can be taken to the work, no matter where it may be located. For instance, in a railroad shop there should be outlets adjacent to each stall in the roundhouse, one or more on the washing tracks outside, and others in places through the shop. In a boiler shop there should be an outlet on every other column, and in a large machine shop there should be an outlet adjacent to each of the larger machines, in order that work may be done in filling up blowholes and other defects on large castings with the minimum amount of crane handling. One solution of the problem would, of course, be to locate a panel outlet of a suitable type wherever it is anticipated that electric welding might be desired. However, this is rather an expensive proposition, and many electrical engineers would prefer to accomplish the same result in a simpler manner. A recently-developed portable outlet panel manufactured by the Westinghouse Electric and Manufacturing Company takes care of this situation with a minimum of expense and with all the simplicity of the familiar distributing system for storage battery charging.

Two types of portable outlet panels are furnished, both being mounted on light trucks. They consist of a control panel mounting a handle trip railway type circuit breaker having overload release, with magnetic blowout, and a 13-point face plate connected to a resister mounted in the rear of the panel. The face of the panel is protected by a metal cover, through which the handles of the rheostat and circuit-breaker project. The resister is made up of grids, and is protected by a cage of expanded metal. Type E panel is intended for metal electrode welding only, having a capacity of from 80 to 170 amperes. With this outfit one metal electrode holder and one shield are supplied. For a wider range of work a Type F panel should be used. This will handle metal electrode work from 80 to 160 amperes, and light graphite electrode work up to 300 amperes. The outfit includes one metal electrode holder, one graphite electrode holder, and one mask.

In installing an electric welding system using these portable panels, the best method is to place a Westinghouse arc welding motor generator set at some central point. Where suitable low resistance ground connection can readily be made throughout the shop, as, for instance, where metal floors or cast-iron bedplates are in general use or in a railway shop where the track system can be used, only one connector need be extended to the various receptacles. The iron floor plates may be arc-welded to each other and isolated sections tied together by an iron rod or heavy copper cable, while the track

rails may be bonded by arc-welding the fish-plates to the rails. Receptacles should then be provided at suitable points throughout the shop of a capacity appropriate for the service for which they are intended. These receptacles may readily be mounted out of doors if they are provided with protection from the weather. Only single-pole receptacles and a single wire cable to the portable panel need be provided. This cable should be of sufficient length so that the panel may be placed as near as possible to the work in order to save steps and valuable time for the welding operator. The flexible cable leading from the panel to the electrode holder should be as short as is consistent to the class of work to be done.

Where metal floors or tracks are not available, the ordinary two-wire system of distribution, with double-pole outlets and two-wire cables, should be provided.

To Patch Japan-Finished Surfaces

When the black enamel or japan finish on motors, generators, or in fact any electrical apparatus, has chipped off or has been knocked off by rough usage, common black paint is often used to cover up the spots. Such painted patches are scratched easily and soon lose their luster. A much better substitute can be secured by using the following mixture: Asphalt, one pound; lamp black, one-quarter pound; resin, one-half pound; spirits of turpentine, one quart, and enough linseed oil to make the lampblack into a paste before mixing it with the other ingredients. Mix thoroughly and apply with a varnish brush.—Electrical Review.

"Contact"—A New Westinghouse Dealer Magazine

To stimulate dealer interest and co-operation, the Westinghouse Electric and Manufacturing Company has begun the issuance of a monthly publication this month. This new paper is to be known as "Contact," and is the same size as the Saturday Evening Post, to permit effective display of its contents and full scale reproduction of advertisements in national mediums. The new magazine will replace the Westinghouse company's monthly "Merchandising Calendar," and also the special publications distributed on merchandising campaigns, which are issued from time to time throughout the year. The intention is to make "Contact" a clearing house of ideas for Westinghouse distributors. Whether these ideas cover window display, stock accounting, stock arrangement, canvassing or any merchandising problem, they will be welcome in its columns. New sales ideas, successful campaigns, plans for more business, for bigger profits, for better service from employees are being solicited by Westinghouse representatives throughout their trade. The first issue contains articles on getting rid of after-Christmas stock; bigger profits by better planning of advertising according to a definite schedule; sales letters that "bring home the bacon;" the value of the proper spending of our money in winning the war.

Personals

Mr. Philip Pocock was recently elected chairman of the London, Ont., public utilities board.

Mr. H. S. Shearer has been appointed manager of the Smith's Falls Hydro-electric System.

Mr. R. H. Long, formerly electrical superintendent of the Winnipeg Electric Railway Company, has been appointed power superintendent.

Mr. James Wilson, assistant secretary-treasurer of the Three Rivers Traction Company, Three Rivers, Que., has been appointed secretary-treasurer.

Mr. E. G. Mack, managing director Crouse-Hinds Company of Canada, has been elected a member of the Council of the Toronto Board of Trade.

Mr. Walter R. McRae, chief mechanical superintendent of the Toronto Railway Company, has recently been elected a member of the American Institute of Electrical Engineers.

Mr. W. R. Way, Montreal, of McGill University, has been awarded the Student's Prize of the Canadian Society of Civil Engineers for a paper on "Insulated Power Cables."

Lieut.-Col. C. H. Mitchell has been mentioned for the fourth time in despatches and, simultaneously, it is announced that he has been awarded the Croix de Guerre by King Albert of Belgium on the occasion of his recent removal to the Italian theatre of the war.

Major George C. Royce has been appointed Commandant of the Canadian Hospital at Bromley, Eng. Major Royce recently relinquished the rank of Colonel in order to get overseas. For some time previously he had been in command of the interment camp at Kapuskasing, Ont.

Mr. Howard Murray has been made an officer of the new Order of the British Empire. Mr. Murray was for many years connected with the Shawinigan Water and Power Company, as treasurer and vice-president. Several months ago he accepted a position with the Imperial Munitions Board, Ottawa.

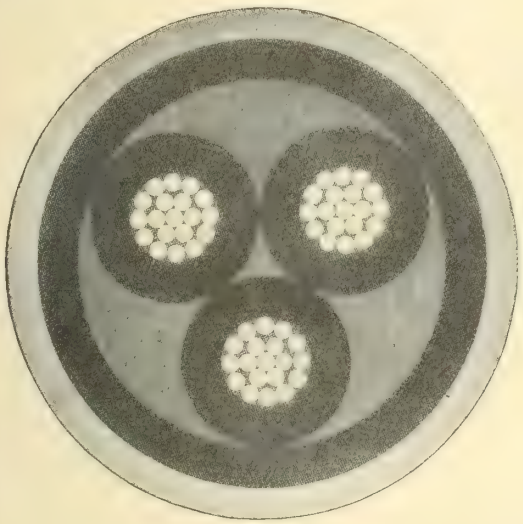
Mr. Guy E. Tripp, of New York, heretofore chairman of the Westinghouse Electric and Manufacturing Company, has been appointed by the War Department as chief of the production division of the Ordnance Department, entrusted with the task of supervising and stimulating the production of all ordnance supplies. Mr. Tripp has been given a commission as colonel.

Mr. Charles F. Gray, M.I.E.E., M.A.I.E.E., consulting electrical engineer, Winnipeg, Man., was again elected, at the last civic election, to the position of Controller, in charge of Street Commissioner's Department, Fire Department, Civic Offices, Assessment Department, Building Inspection, Library and Public Baths. At the organization meeting of the Council Mr. Gray was also placed on the Police Commission.

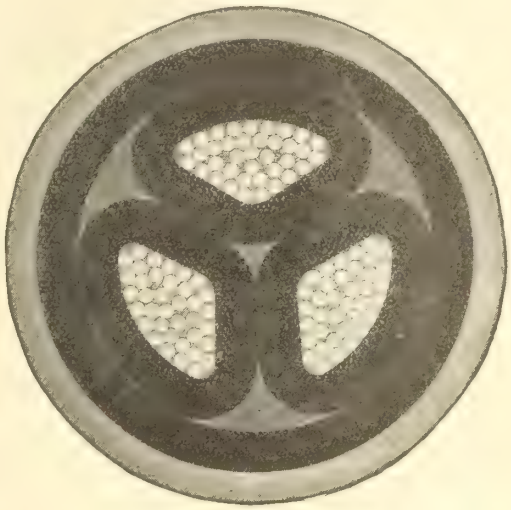
Mr. Frank D. Laurie has been appointed manager of the Hamilton branch of the Bell Telephone Company, in succession to the late Mr. G. D. Richmond. Mr. Laurie has been manager of the company's branch at Chatham, in whose municipal life he took an active part, having been chairman of the Board of Education and also alderman. He is succeeded at Chatham by Mr. R. L. Stratton, manager of the company's Owen Sound exchange.

Lieut.-Col. Campbell Stuart, of Montreal, has received the title of Knight Commander of the Order of the British Empire. He is vice-chairman of the London headquarters of the British Mission to America. Prior to that he was in the employ of the Bell Telephone Company in Manitoba, subsequently becoming senior partner in the firm of Stuart, Drinkwater & Hingston, and vice-president and managing director of the A. B. See Electric Elevator Company of Canada, Montreal. After joining the Irish-Canadian Rangers as captain he was promoted to lieutenant-colonel and sent to Washington as an attache of the British War Mission.

Obituary



Mr. George Kenric Boright, formerly on the staff of the Canadian Westinghouse Company, died on January 10, at the home of his parents, Cowansville, P.Q., aged 33 years. He graduated at McGill in 1910, ranking second in the electrical engineering class of that year. Mr. Boright spent about a year and a half at the works of the Westinghouse Company, Hamilton, and later was transferred to Montreal, where for three and a half years he was on the technical staff. He was ill for several months, suffering from tuberculosis, and in September went to the Laurentian Mountains.



Mr. Charles B. Ellis, superintendent of supply sales of the Canadian General Electric Company, Montreal, died in the Homeopathic Hospital, after two weeks' illness, aged 41. Death followed an operation necessitated by an injury received in the Boer war. An Englishman by birth, he was for many years connected with the Canadian electrical business, holding a position in the Northern Electric Company prior to joining the Canadian General Electric a few months ago. There was a very large attendance of representatives of electrical interests at the funeral.

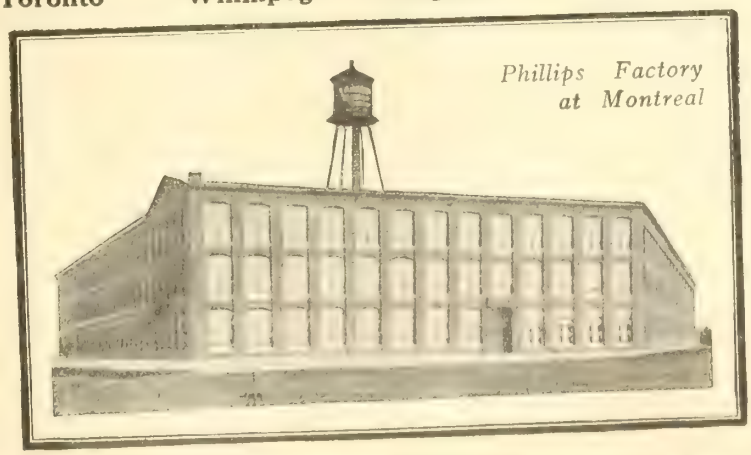
According to official statistics, during 1916 municipalities in the Province of Quebec increased their holdings in electric plants from $2,867,801 to $4,105,001, while those in telephone systems declined from $307,230 to $75,105.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Current News and Notes

Alliston, Ont.

It is expected the Hydro transmission line from Barrie to Alliston will be completed as far as Cookstown shortly and that it will reach Alliston early in February.

Bassano, Alta.

The purchase of an electrically-driven pumping unit is under consideration by the Water Works Department, Bassano, Alta.

Coleraine, Que.

The Canadian General Electric Company has obtained the contract for the entire electrical equipment of the Bennett-Martin Asbestos & Chrome Mines, Limited, Coleraine, P.Q., for which Mr. M. A. Sammett, Montreal, is the consulting engineer. The equipment consists of three 300 kv.a. self-cooled, oil-insulated, 45,000 volt transformers; one 650 h.p.; one 275 h.p.; one 150 h.p., and one 25 h.p. induction motors; an automatic induction regulator; switchboard panels for the control of the motors, and some miscellaneous auxiliary apparatus. The equipment is of 30 cycles. A transmission line, 4 miles long, will be constructed, the insulations to be supplied by the Canadian Porcelain Company, Hamilton, and the wire by the Canadian Wire & Cable Company, Toronto. A contract for power has been closed with the Shawinigan Water and Power Company, connection being with a sub-station at Black Lake, P.Q.

Elora, Ont.

At a recent meeting of the Elora, Ont., Hydro-electric Commission Mr. T. E. Lipsey was elected chairman for the coming year. It was reported that the local system is in a splendid and paying condition.

Eugenia Falls, Ont.

Work is progressing favorably on the extension to the Hydro development at Eugenia Falls. This work includes the installation of a 4,000 h.p. unit and extension to the power house to include additional transformer capacity and switching equipment. It is expected the new unit will be in operation within four or five months.

Hamilton, Ont.

At a regular meeting of the Hamilton Hydro-electric Commission, held recently, Mr. T. J. Stewart was elected chairman for the year. The estimated annual revenue for 1917 was $123,650, as compared with $74,723 for 1916.

London, Ont.

It has been announced by the London Public Utilities Board that plans have been completed for a $60,000 addition to the Hydro power station.

Montreal, Que.

The Southern Canada Power Company, Montreal, are contemplating the construction of about 100 miles of high tension transmission line and have asked tenders on poles, cross-arms, insulators, cross-arm braces, wire and other material.

Nelson, B.C.

The Waneta Power Company, Limited, has been incorporated with a capital of $1,500,000; head office, Nelson, B.C. The new company will take over the development and assets of the Waneta Development Company, Limited.

Newboro, Ont.

The ratepayers of the village of Newboro, Ont., recently carried a by-law to have their electric lighting brought in from Bedford Mills. A 20-light incandescent street lighting system will be installed in the early spring. Supplies required by the manager of the Newboro electric plant.

Perth, Ont.

The Perth Hydro Commission, recently organized, consists of Mr. W. B. Hart, as chairman; Mr. J. H. Echlin and Mayor Hands. Mr. R. J. Smith is secretary.

Petrolia, Ont.

The Hydro-electric Commission of Petrolia, Ont., report that for the ten months ending November, 1917, the total revenue amounted to $15,407, as compared with $4,739 in 1916.

Rossland, B.C.

The annual report of the West Kootenay Power and Light Company for the year ending August 31, 1917, shows that the net surplus amounted to $30,930, as compared with $70,827 for 1916. This was, however, after writing off $99,736 for plant depreciation and providing $182,666 for dividends on preferred and common shares. For the year ending August 31, 1916, the revenue producing load was 11,152 h.p., and in 1917, 22,511 h.p. New contracts have been secured which promise to add very substantially to the company's earnings.

Stratford, Ont.

The work of building a new 26,000 volt sub-station at Stratford, Ont., and installing the necessary equipment is practically completed. All municipalities supplied from this station will receive their power at 26,400 volts instead of 13,200 volts as at present.

Sudbury, Ont.

It is stated that the impossibility of getting power at less than $46 per h.p. may lead to the British-American Nickel Company, of Sudbury, abandoning plans to erect a nickel refinery in that district. The company, it is further reported, is looking to Ottawa as a possible site, where the Hydro Commission have a surplus of power available for immediate use.

Toronto, Ont.

Negotiations are proceeding with a view to the acquirement by the Hydro-electric Power Commission of Ontario of the Essex County Light and Power Company's plant and business which is at present owned by the Detroit Edison Company and supplies power to Windsor, Walkerville, Sandwich and Essex.

The Hydro-electric Power Commission of Ontario have awarded contracts for two generators and turbines for the extension of their Ontario Power Company's plant at Niagara Falls. The generators, 15,000 kv.a. capacity, are being supplied by the Canadian General Electric Company. The turbines have been purchased in the United States and will be shipped immediately.

Vancouver, B.C.

An electric lighting plant will, it is understood, be installed at the shipbuilding yards of J. J. Coughlan & Sons, Vancouver, B.C.; also twelve electrically operated cranes.

Winnipeg, Man.

Gross earnings of the Winnipeg Electric Railway, according to returns made to the city, amounted to $1,088,756 in 1917, being a decrease of $1,322,413, or 40 per cent. The municipality gets five per cent. on gross, or $99,437, besides $20 on each car. Net earnings are not yet available.

ATTENTION!

CANADIAN-MADE SWITCH PLATES

No. 7054

We are in a position to quote attractive prices, and deliveries, on any quantity of single gang flush switch plates.

In times like the present, why send your money out of Canada? Besides getting goods that are Canadian-made, and keeping the money in the country, you can get from us products that are equal, if not superior, to those that are imported.

Write us for samples and prices.

Toronto & Hamilton Electric Co.

99-103 McNab N., HAMILTON Limited

THE NATIONAL AUTHORITY FOR TWENTY-FOUR YEARS

THE 1918 EDITION

POCKET SIZE
LEATHER COVER

"STANDARD WIRING"

TELLS YOU HOW

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or for A. C. single, two or three-phase.

OUTSIDE WIRING—Pole line construction, line wires, service wires, roof structures, poles and their dimensions and weights, and how to erect and protect them and wires they carry. Insulators, guard arms, guy anchors. Tree wiring, splicing, service and entrance wiring. How to install Lightning arresters. Transformers with diagrams and instructions.

INSIDE WIRING—When and where to use rubber covered, slow burning and weatherproof wire. How to find the proper size of wire to use for lamps, motors or heating devices for any current, voltage and drop, either by formula or by the many tables that are given in this section of the book. How to wire for two-wire or three-wire systems. Direct current, two-phase and three-phase with formulae and tables, with examples worked out for each system and in a simple manner that anyone can understand and use. How to run wires on walls, ceilings, floors, through partitions and walls and in concealed places, damp places and where dangerous surroundings exist. When and where to install Switches, Cut-outs and Circuit Breakers and just how to do it. How to wire for high and low voltage systems and the precautions to be taken. The proper way to install Knife and Snap Switches, Cabinets and Cut-out Boxes, Outlet, Junction and Switch Boxes, Panel Boards, Wooden and Metal Raceways. How to install complete interior conduit jobs either for rigid metal, flexible metal or flexible non-metallic conduit. Concealed knob and tube work or armored cable. How and where to install and wire electric and combination lighting fixtures. How and where to use flexible cord and where not to use it. How to install arc lamps and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and gas filled lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination and where each should be used. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

Metropolikus offers you this booklet on

Did you get your copy?

METROPOLITAN Enclosed Fuses are being introduced by one of the largest users of fuses in the world.

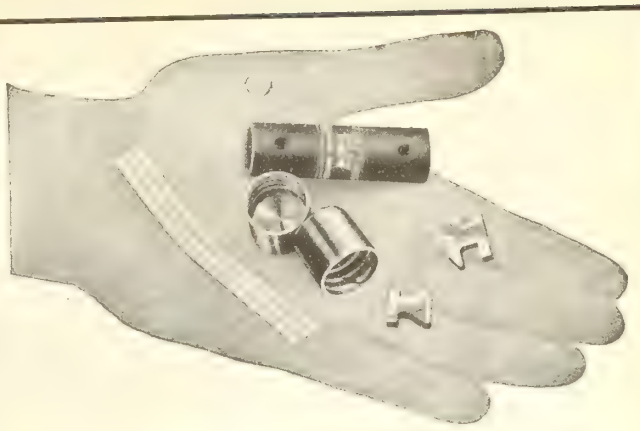
Our experience extends over twenty-five years, in which time we have used all makes of fuses. We know the requirements of a good fuse, and now we are making a fuse based upon this knowledge. Every fuse is made from the best of material that we can procure.

Every fuse is rigidly tested. Every fuse is made by competent experts.

Metropolitan fuses are approved by the National Board of Underwriters Laboratories.

Let us submit prices and samples. You will find both right.

A Switch Board and Panel Board organization of twenty-five years' experience is back of this new fuse.



Send for the booklet now

METROPOLITAN ELECTRIC MFG. CO.

LONG ISLAND CITY - NEW YORK

R. E. T. Pringle, 95 King St. East, Toronto—Agents

TRADE AUM MARK **Renewable Fuses**

FOR ELECTRIC LIGHT AND POWER

Always were the simplest fuses in construction on the market. The new Type "B," Form 4, has been reduced to the fewest parts—four metal parts of solid brass, a fibre shell and the fuse strip. Caps are removed by a twist of the wrist and as easily tightened, holding the fuse strip in intimate metal-to-metal contact.

Free Samples If You Write Today

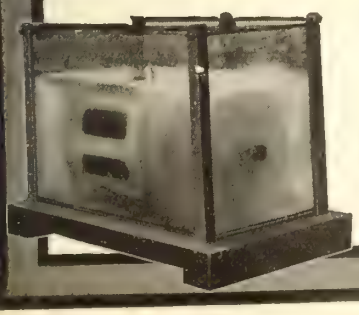
LINCOLN MOTORS

For Chemical Plants

The insulation on Lincoln Motors protects the windings against damage from acids, alkalies, and other chemical solutions.

In many large installations the motors are driving pulverizers, mixers and general machinery under the most severe conditions.



Lincoln Motors have been adopted in a number of Chemical Plants after long comparative service tests of several different motors.

Westinghouse

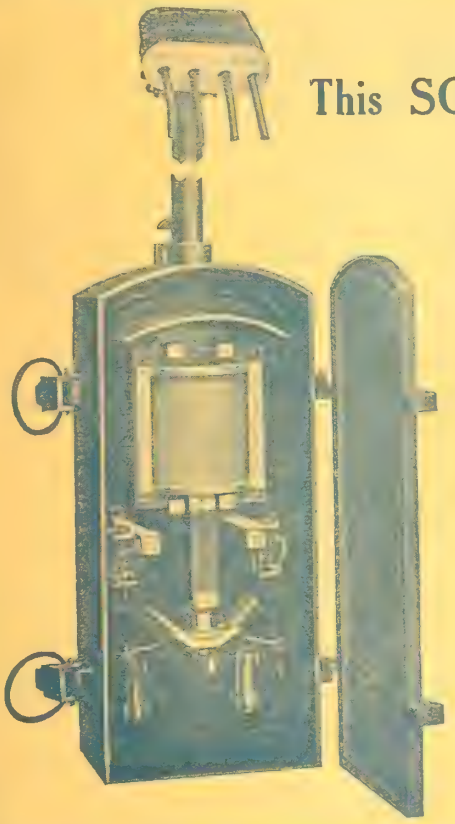
Electric Irons with Attached Stand

Practically indestructible, few parts, no delicate pieces, efficient, long life, monoplane heating element.

Radiation from top prevented by dead air space, all heat given off at ironing surface.

A heat storage plate stores the heat not being taken by the ironing surface, making the iron stay hot longer.

The weight, 6¾ lbs., makes heavy ironing easy, but is balanced so nicely that the finest lingerie is ironed with ease.



The handle fits the hand, and is so sloped that it takes the strain off the wrist.

The attached stand enables you to turn the iron upside down and use it as a hot plate.

This is the Most Satisfactory Iron to Handle

This SOLENOID SWITCH has been adopted by the Hydro Electric Commission

They use it for

STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment, by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

Nights Beach 1723 1930

This Steam Dryer was Built

entirely by the

OXY-ACETYLENE WELDING PROCESS

tested at 300 lbs. pressure, and has proved satisfactory in every respect ever since.
Firms all over the world are specifying WELDED joints because they know from actual experience that the **Welded Joint** is the best in point of Efficiency, Economy and Durability.

The Process has now become an indispensable factor in the Metal Working Industries—

REDUCING MAINTENANCE COSTS
INCREASING PRODUCTION

The cost of an "A.L.S." Oxy-Acetylene Welding Outfit is Small

The applications for the Process are unlimited

One or two jobs are often sufficient to pay the total cost of a plant. For reclaiming broken machine parts and castings; preventing waste by using up material otherwise unusable; adding metal to parts deficient by wear or breakage; making an absolutely trouble-proof joint; Cutting Iron and Steel in less time [illegible] etc., an outfit is not only a profitable investment but an absolute necessity.

Write to-day for particulars—free, without obligation.

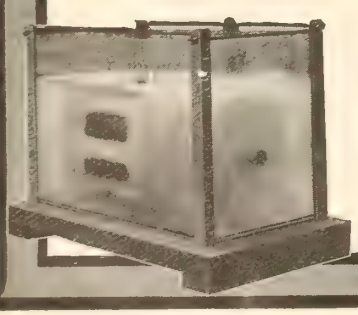
LINCOLN MOTORS

More Power To You

That's just what it would mean if the metal working plants in your territory could be given only a glimpse of the possibilities in electric arc welding.

There isn't a piece of apparatus made which will return you more power sales for little effort than

The Lincoln Arc Welder



Every steel foundry, forge shop and stamping plant in your territory—every plant where metals are joined or breakage and wear of metal repaired—50 per cent. of the shops where acetylene is used—are prospects for electric arc welding.

You do not have to sell them, just interest them and we will send our welding engineers to go over the proposition and close the sale.

Write us for literature and information on any welding job you run across.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

POCKET SIZE
LEATHER COVER

"STANDARD WIRING"

TELLS YOU HOW

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or for A. C. single, two or three-phase.

OUTSIDE WIRING—Pole line construction, line wires, service wires, roof structures, poles and their dimensions and weights, and how to erect and protect them and wires they carry. Insulators, guard arms, guy anchors. Tree wiring, splicing, service and entrance wiring. How to install Lightning arresters. Transformers with diagrams and instructions.

INSIDE WIRING—When and where to use rubber covered, slow burning and weatherproof wire. How to find the proper size of wire to use for lamps, motors or heating devices for any current, voltage and drop, either by formula or by the many tables that are given in this section of the book. How to wire for two-wire or three-wire systems. Direct current, two-phase and three-phase with formulae and tables, with examples worked out for each system and in a simple manner that anyone can understand and use. How to run wires on walls, ceilings, floors, through partitions and walls and in concealed places, damp places and where dangerous surroundings exist. When and where to install Switches, Cut-outs and Circuit Breakers and just how to do it. How to wire for high and low voltage systems and the precautions to be taken. The proper way to install Knife and Snap Switches, Cabinets and Cut-out Boxes, Outlet, Junction and Switch Boxes, Panel Boards, Wooden and Metal Raceways. How to install complete interior conduit jobs either for rigid metal, flexible metal or flexible non-metallic conduit. Concealed knob and tube work or armored cable. How and where to install and wire electric and combination lighting fixtures. How and where to use flexible cord and where not to use it. How to install arc lamps and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and gas filled lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination and where each should be used. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

APPROVED SERVICE FITTING

Cat. No. FB712

Replaces Types B, BE, F, and FE.

TYPE "FB" ENTRANCE FITTINGS

These fittings have reversible hubs, permitting installation either as type "F" fittings on vertical pipe, or type "B" fittings on horizontal pipe.

The same parts are used for ½ in., ¾ in., and 1 in. fittings, excepting hubs, there being a separate hub for each size. The covers and porcelain are interchangeable from one size fitting to another, giving a very flexible stock arrangement.

Metal parts black japan or galvanized finish. Black japan furnished unless otherwise specified.

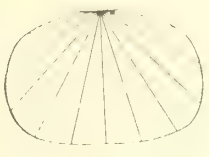
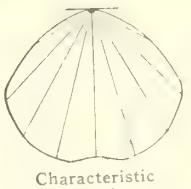
WHEELER REFLECTORS

NES



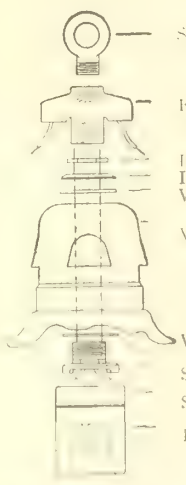
WER



PES

Characteristic Angle Light Distribution

Characteristic Light Distribution



Characteristic Intensive Light Listribution

Designed and manufactured by Specialists in Industrial Illumination with long experience in the production of Reflectors to meet every condition of operation.

Performance and Construction

Reflectors must be selected for the work conducted by their light. The Characteristic Light Curves indicate the performance. General Illumination with Group "W" (Wide) Reflectors is best adapted to large rooms and bays. Localized Lighting with Group "P" Reflectors for confined spaces, individual machines, work benches, etc., and Group "N" (Angle) Reflectors mounted on the side walls, serve areas inaccessible from above because of moving cranes or high standing apparatus.

Wheeler Reflectors are fitted with holders for brass or porcelain sockets, with collars to fit standard holders, with detachable canopies or canopies enameled in one piece with the reflector. Sockets are secured to nozzles with hexagonal shoulders fitting hexagonal holes in canopies to prevent turning. The general construction is substantial and readily accessible for wiring.

O-B PRODUCTS

O-B Extended Trolley Ear

On Round Wire, generous amount of metal in lips.

On Grooved Wire, perfect wheel clearance

On Figure 8 Wire, perfect wheel clearance.

O-B Extruded Ears

For Long Life

Long life is actually squeezed into Extruded Ears in their manufacture.

Forced through a die under great pressure, extruded metal is extremely dense and absolutely uniform. These qualities imparted to a specially selected alloy make it ideal for the runner pieces of trolley ears.

A malleable iron boss is fastened securely. It is O-B Sherardized.

O-B Extruded Ears show their superiority when installed on the same line with other ears.

O-B Engineers will gladly help solve your intricate overhead problems. They are familiar with construction on nearly all the lines of the country, and are experienced in adapting standard materials to special conditions.

Vol. 27 Toronto, February 15, 1918 No. 4

Can We Avoid a Recurrence of "Heat" Shortage?—Not Unless We Act Promptly

The people of Ontario and Quebec will now realize, as many have not done heretofore, that the fuel situation is one of the big problems calling for solution in the immediate future. So long as our coal supplies continued to come in regularly the tendency of the public has been to close their eyes to the narrow margin of safety on which we have been operating for some years. Now, however, after all classes of our citizens have felt the pinch and have realized that we are dependent for our future comfort not entirely on the friendship of the United States, but also on the ability of that country to supply our needs in the way of coal, it is reasonably certain that about the most uppermost thought in everybody's mind to-day is—what can we do? How can we prevent a repetition of our present winter discomfort and disorganization of business?

The province of Ontario and the western portion of the province of Quebec, being farthest removed from the Canadian coal fields, are naturally most vitally concerned with the solution of the coal shortage problem. It is no great strain of the imagination to foresee heavy fatalities in the future due to fuel shortage. There is comparatively little left throughout the country in the way of forests, and the "cry-out" that farmers are hauling coal out of the city when they ought to be using wood simply demonstrates that wood is not easily available. If it were otherwise, indeed, such extortion as we read of in the local press in the way of wood prices could not exist. There is evidently a shortage of wood, just as there is of coal; the shortage of labor in the country accentuates the difficulty.

To prevent real calamity, therefore, there is plainly no alternative course open to us than to utilize whatever other sources of heat supply we can lay our hands on. We have a considerable quantity of peat in these two provinces. Years ago it was demonstrated that this could be worked up into marketable form. No action has ever been taken, however, on account of the cost—it might not pay, in competition with coal at the prices then prevailing. Under the conditions of to-day these areas should be exploited at once that a supply may be available for next winter.

Then, there is the almost inexhaustible lignite supply of western Canada. Some time ago this situation was investigated by the Industrial Research Council and a recommendation made to the government that some half-million dollars be expended on a plant for briquetting this fuel into a form suitable for shipment. Cost of carriage may prohibit its shipment into the central and eastern parts of Ontario under normal conditions, but, again, cost may not always be the determining factor, and such a plant, as a safeguard, would be a fine asset to the people of Canada. Our government, therefore, in our opinion, should immediately proceed with the construction of a plant, as recommended, to be added to as experience is gained.

Finally, there is our water powers. It is a simple fact that much suffering has been avoided in the larger towns and cities of Ontario and Quebec during the past two months by the use of electric heat. An example is a case of pneumonia in an apartment house which ran entirely out of coal and where a satisfactory and instant substitute was found in a couple of electric heaters. And in thousands of homes and offices it has been used as an auxiliary. Paradoxical as it may seem, electric heaters, even where operated by steam plants, have been very real fuel conservers, for by supplying localized heat, they have made it possible to operate the main heating system of many homes at a very much lower capacity. It seems specially urgent, therefore, that every encouragement and assistance should be given to development of our water powers so that they may be available as a substitute for coal at the earliest possible moment.

We have reached a stage where "first cost" is not the prime consideration. Since we cannot do without fuel we must needs pay what it costs. In view of the experiences of the present winter the duty of our government is to safeguard us against their recurrence. Since this will take time a start should be made without further delay.

A Matter Easily Adjusted by the Power Controller

Sir Adam Beck is reported as having made the statement that one of the power generating companies at Niagara Falls is deliberately operating at less than full capacity—apparently having in mind the Electrical Development Company. Either the charge is true or it is not true.

If it is true, in view of present electric power shortage, such action is nothing short of criminal. However, there was recently appointed, by the Dominion Government, a Power Controller, whose business it is to look into just such matters. Without a shadow of a doubt he has power to investigate operating conditions in the generating plant of the Electrical Development Company. If the plant is operating under capacity he has ample power to apply a remedy. If he does not know or, knowing, has not applied the remedy, he is criminally negligent in the performance of his duty.

If what Sir Adam Beck charged is not true he should have known that it was not true and should not have laid

himself open to the implication that he was trying to extricate himself from a most difficult position by laying the blame on others.

Two New Supplementary Orders

The Power Controller has thrown a little further light on his order of January 8 by the following additional order, dated February 4, which reads as follows:

In the matter of "The War Measures Act 1914."

In the matter of the order-in-council, dated November 6, 1917, numbered P. C. 3142, and the order of January 8, 1918, issued as Power Controller appointed under the said order-in-council, and in pursuance of the powers thereby conferred.

Whereas by the said order of January 8, 1918, purchasers and consumers of electrical energy in the districts of Western Ontario served by power generated by the Niagara River were, inter alia, prohibited from using such energy for "advertising purposes or ornamental lighting."

And whereas a doubt has been raised whether such prohibition applies to window and other display lighting.

It is therefore ordered and declared that the words "advertising purposes or ornamental lighting" include the lighting of windows and other display lighting; and the said order shall be read accordingly.

Dated at Ottawa this fourth day of February, A.D. 1918.

(Sgd.) H. L. Drayton,
Power Controller.

This is supplemented by a similar order, signed by W. W. Pope, secretary of the Hydro-Electric Commission, as follows:

In the matter of the order of the Power Controller, bearing date the 8th day of January, 1918, and his declaratory order respecting the same bearing date the 4th day of February, 1918, copy of which is hereto attached, and the commission's order, bearing date January 8, 1918.

Whereas by the said order of the Hydro-Electric Power Commision of Ontario of January 8, 1918, all municipalities, commissions, companies, or persons being supplied with electrical power and energy by the commision, were, inter alia, on and after the 15th day of January, 1918, prohibited from using such energy for advertising purposes or ornamental ilghting.

And whereas a doubt has arisen as to whether such order applies to window lighting, it is therefore ordered and directed that the words "advertising purposes or ornamental lighting" includes the lighting of windows and other display lighting; and the said order shall be read accordingly, and shall take effect from and after the 5th day of February and remain in force until further notice.

Dated at Toronto, this 4th day of February, A.D. 1918.

Hydro-Electric Power Commission of Ontario,
W. W. Pope, Secretary.

This is evidently to be interpreted as meaning that all window lighting must be discontinued.

Tax on Public Utilities

In the Quebec Legislature the matter of placing a tax of 5 per cent. on the property in the streets of public utility companies was discussed a few days ago. The first idea of charging 5 per cent. on the gross receipts of such companies was abandoned. Mr. Laurendeau said the value of such property was $6,400,000. Aime Geoffrion, K.C., appeared for the Montreal Light, Heat and Power Company, and said that his company was willing to contribute to help meet the deficit, and were agreed on the principle of paying for a period of three years, but believed 5 per cent. was altogether too high, and suggested 1 per cent. He pointed to the taxes that the company was paying Montreal already; also to the fact that the real estate tax was going up, and that, under a recent judgment of the court, the utility companies had to pay not only for the share of the underground conduits that their wires occupied, but also for a proportion of the vacant space, the conduits having been made larger than necessary in order to provide for new companies. If the tax was made unduly high, the effect would have to fall upon the users of gas chiefly, and this class of people were poor.

Leon Garneau, K.C., spoke for the Bell Telephone Company. "Don't you think that the company charges enough for phones?" asked Mr. Mayrand (Dorion).

"That is a reason for not forcing the company to raise the rates by making an application to the Dominion Railway Commission," said Mr Garneau. "Heavy taxes will force the company to apply for an increase."

Alphonse Decary, K.C., appeared for the Montreal Water and Power Company, and pointed out that his clients were in a different position to the other utility companies. The company for twenty-five years had not been able to pay a single cent of dividend.

Alderman Turcot, deputy for Laurier, said the company charged 7½ per cent. for water, and Mr. Decary said that, notwithstanding charges, there was no profit, and the company was unable, because of its iron-clad contracts, to raise the price of water, and there was no reason for forcing another heavy burden upon it. The telephone and electric companies could raise their rates; the Water and Power Company could not do so.

Mr. David, of Terrebonne, asked for a suggestion as to what would be reasonable, and Mr. Decary mentioned 1 per cent. Sir Lomer Gouin closed the argument by saying that all the companies were agreed on the principle of paying this surtax to aid in the city for a period of three years, and the only question was to determine what rate should be charged. He asked Mr. Geoffrion for another quotation, and Mr. Geoffrion said he was willing to have the rate 2 per cent. The committee made it 5 per cent., except in the case of the Montreal Water and Power Company, this being fixed at 1 per cent.

Sir Lomer remarked that $300,000 among the public utilities companies would not be a great thing. The sources of revenue had to be increased. The tax was not an attack on capital, but the deficit had to be met.

Conservation of Canadian Trade

An interesting booklet, entitled "Conservation of Canadian Trade," a discussion of trade conditions after the war, the necessity for preparedness, responsibility of the government, with some valuable suggestions relating thereto, by Hon. Frederic Nicholls, president and managing director of the Canadian General Electric Company, has just been published. Senator Nicholls is chairman of a special committee of the Senate of Canada on Conservation of Canadian Trade, and the booklet is chiefly a reproduction of certain of his addresses and letters that have dealt so forcefully, in the Senate and elsewhere, with the facts concerning this important question. In the "foreword" Senator Nicholls points to the uncertainty of trade conditions after the war, which is causing grave anxiety to business men throughout Canada, and adds:

"The balance of trade is now greatly in our favor, and Canada is prosperous; in fact, so prosperous that little heed is being given to preparation for the inevitable 'slump' that will be experienced when the demand for our output diminishes and present high prices are no longer current.

"Undoubtedly much could be accomplished by the mobilization of our resources, intelligent co-operation in producing and selling, and courageous effort on the part of the government, which is well advised as to the problems to be met.

"In time of war we should prepare for peace and it will be

unfitting to our dignity as a patriotic and resourceful Dominion if prompt and decisive preparations are not made to meet the new conditions which we will soon be called upon to face."

The booklet is timely and the subject matter is presented in such a masterly fashion that it demands the earnest study of all thinking Canadians.

Splendid Lectures Before the Electric Club of Toronto

On Friday, February 1, Col. G. G. Nasmith, Ph.D., C.M.G., addressed the Electric Club of Toronto, describing the system prevailing in France for keeping the men fit. This involved, among other things, special precautionary measures regarding food and water, especially the latter, and the immediate and complete isolation of all cases of contagious disease. Among many other gratifying evidences of the efficiency of the organization of the Army Medical Department, Col. Nasmith mentioned the incredible speed with which the sick and wounded are frequently transported across the channel, the space of twenty-four hours being sufficient, in many cases, to make the transfer from the front line trenches to a comfortable hospital ward in England. Col. Nasmith's work was more particularly associated with the purification of the supply of water, for his notable achievements in which connection, it will be remembered, he received his decoration.

Professor Alfred Baker was the guest of the Club and the speaker on February 15. He spoke on a most interesting phase of after-the-war problems—the probability that Canada or England would find the national debt so burdensome as to retard commercial recuperation. By comparing the figures for population, trade, productivity and debt following previous wars, with the probably corresponding figures when the present war is over, he was able to demonstrate that the British Empire, unless the war drags on interminably, will emerge from it under much more favorable conditions than has been the case following previous wars. Regarding the probable shortage of money, which is so generally deplored, it was pointed out by Professor Baker that, like the small bullet, which owes its destructiveness to its speed, so the smaller amount of money can be made tremendously effective by rapid turnovers.

The speaker made an interesting allusion, in passing, to the probable outcome of the so-called socialistic movement. We are all socialists, more or less, and there are many practical examples at work in our midst to-day. Free schools is one example, national railways another. It is the extreme socialism that is objectionable. The problem will best be solved by utilizing the best elements in the socialistic programme. Just as republicanism has been avoided and the best form of government in the world—a limited monarchy—has been preserved to us by a recognition of the most reasonable features of democracy, so socialism in its objectionable form will be disarmed by the absorption into our existing constitution of such parts of the socialistic creed as will tend to bring closer together into a mutual understanding those elements in our citizen life which at the moment seem to be out of tune.

Activities of the American Institute

It is generally the case with the meetings of the A.I.E.E. that a non-technical subject for a lecture results in a very poorly attended meeting. This, however, was not the case on Friday, February 1st, when Prof. A. P. Coleman addressed the Toronto section. Fully fifty-five members and their friends were present, and there is no question that everybody appreciated to the full the description by Dr. Coleman of his recent trip across the South American continent. The lecture was illustrated by a wonderful series of lantern slides, reproduced from photographs and from personal water-colored sketches, for which the professor is widely famed.

On Friday, February 15th, the Section is to have the privilege of a paper by Mr. C. R. Dooley, of the Westinghouse Company, Pittsburgh, on the subject, "Training Men for Industry." As a lecturer, Mr. Dooley has few equals, and is it anticipated that this meeting will be perhaps the most successful of the whole season. It is anticipated that several gentlemen of some importance in the field of vocational education will be present to discuss this many-sided subject. A well-known Canadian engineer who is acquainted with Mr. Dooley's work, says: "Mr. Dooley has spent many years studying the technical educational problem from an aspect which it is almost impossible for a university educationalist to obtain. He has been culling the wheat from the chaff in the regular run of college graduates from nearly all American and Canadian universities. He has also developed, in connection with some of the foremost electrical engineers of the country, a system of education to supply the special needs of the Westinghouse Company

Several Canadian engineers have recently been elected to the standing committees of the A.I.E.E. Among these may be mentioned:

Mr. Wills Maclachlan (membership).
Mr. W. G. Gordon (transportation).
Mr. H. B. Dwight (transmission and distribution).
Mr. W. L. Bird (power stations).

A paper presented by Mr. Harry Baker, of the Ontario Power Company, to the Toronto Section last fall, on the subject of testing current transformers, has been accepted for publication in the Proceedings of the Institute, and will shortly be available in the form of reprints.

B. C. E. R. Activities

At the first annual meeting of the B. C. Electric Office Employees' Association of Vancouver, held January 14th, favorable reports were read of the first year's work, and the coming year is expected to be even more successful. The following officers were elected at the meeting: George Kidd (general manager), hon. president; W. G. Murrin (assistant general manager), hon. vice-president; A. E. Chambers, president; E. E. Walker, vice-president; P. Lewis, secretary; J. V. Armstrong, treasurer. The executive is: R. Carver, F. E. Reid, J. Lightbody, E. Fatkin, C. Cook, O. C. Mix, A. Forsyth, S. A. Horner, H. Findlay, P. Runcie, A. Manfield, J. Munro, R. V. Moss, W. G. Chandler, J. G. Richardson, F. Potts, E. W. Arnott, F. Fisher, John McNee and Jas. Baldwin, and Misses Reid, Gaerdes, H. Langley and Chadney, with three others to be appointed. The social club committee elected were, R. Lyon, Potts, Graham, Manfield and R. P. Fraser.

Girls for Meter Readers

The Binghamton Light, Heat & Power Company, of Binghamton, N.Y., has employed girls to read meters and deliver bills. It has been found advisable to do this on account of the general labor condition, and it is in line with the policy adopted about six months ago of employing girls in all branches of the work where it is feasible to do so, thereby releasing as many men as possible for war service.

Report on Inductive Interference

The Joint Committee on Inductive Interference, organized in December, 1912, by the California Railroad Commission and authorized to conduct an investigation of the problem of inductive interference to communication circuits by parallel power circuits has completed its work, after continuously investigating this subject for over five years, at a cost of over $100,000, borne jointly by the interested railroad, power, and communication companies and the California Railroad Commission. The investigation has obtained results of great consequence to electrical engineers in all branches of engineering, particularly to railways, power, telephone and telegraph companies, and to manufacturers of electrical apparatus. A knowledge of the work done and the results accomplished will prove indispensable also to such public utility commissions and other public authorities as have jurisdiction over the service of railways and power and communication companies. Some of the general conclusions have been published by the technical press at different times during the progress of the investigation, but practically none of the technical data have thus far been made generally available. From time to time during the course of this work technical reports have been prepared which give the data obtained from the tests and the results and conclusions derived from both the tests and the theoretical studies. Thirty of these technical reports have been selected as being of such general interest and applicability as to warrant publication. In addition to the technical reports the publication will contain final recommendations for rules for the prevention and mitigation of inductive interference and valuable historical matter concerning the investigation with general and technical discussions on the subject. The book will have a complete index and contain approximately 1,000 pages, with over 400 drawings and 30 photographs. The publication is contingent upon obtaining, in advance, a sufficient number of subscriptions to cover the actual cost of printing and binding. Anyone interested in possessing a copy should make application, immediately, to the Commission, at 833 Market Street, San Francisco, Cal.

Summary of Recommendations

The report gives the following as the seven "basic physical principles which underly the rules recommended and which should guide all efforts to prevent inductive interference:"

1. Avoidance of close proximity.
2. Elimination or suppression of harmonics.
3. Limitation of residuals.
4. Reduction of intensity of induction by favorable arrangement of conductors.
5. Neutralization of induction by coordinated transposition systems.
6. Balancing of metallic communication circuits.
7. High grade construction and care in the operation and maintenance of power circuits.

A brief summary of the recommended rules follows:

The first section, entitled: "General Provisions," provides for: (a) Applicability of the rules. Rules on operation and maintenance are to apply throughout; rules for specific parallels, to cases hereafter created; rules not limited to lines involved in a parallel, to new construction and in the event of reconstruction; (b) Co-operation; (c) Method of remedy involving the least total cost; (d) Existing parallels are to be cared for with due diligence, depending on the seriousness of their effects.

The second section consists wholly of definitions.

The third section, entitled: "Location of Lines," requires: (a) Avoidance of parallelism wherever practicable. (b) Advance notice of intention to construct a line which will create a parallel. (c) The distance between parallel lines to be made as great and as uniform as practicable. Where other remedies fail, the separation is to be increased. (d) and (e) Parallels shall be as short, and as free from discontinuities as practicable. Unnecessary crossings of highways are to be avoided.

The fourth section, entitled: "Design and Construction of Lines," (a) Requires attention to quality and workmanship to prevent failures causing interference. (b) Consideration of the configuration of power circuits is required, also the avoidance of excessive spacing, long two-wire branches from three phase lines, and single wire grounded circuits. (c) Power circuits are to be transposed throughout their lengths with barrels of 6 to 12 miles, excepting lines under 12.5 kv. with grounded neutrals, and certain lines located on private rights of way. Existing power circuits are to be transposed outside parallels hereafter created when necessary for capacitance balance, with regard to discontinuities. (d) Inside parallels an adequate transposition scheme, consisting of co-ordinated transpositions in the power and communication lines, if the latter are metallic, is to be installed, determined by co-operative study. In general, at least one barrel shall be placed in the power circuit. At highway separations from telephone lines, three mile barrels should ordinarily be employed. For parallels with telegraph lines six mile barrels are ordinarily sufficient. The most economical scheme and utilization of existing transpositions are to be considered.

The fifth section is entitled: "Design, Construction, and Arrangement of Apparatus." It provides for: (a) Quality and arrangement of apparatus to minimize interference. (b) Rotating machinery should have good wave form. Grounds on generators are to be avoided, unless the arrangements are such as to avoid unbalancing the circuit and introducing residuals. (c) Transformer exciting currents should be as low as is consistent with good practice (for most cases less than 10 per cent. at normal voltage). Grounded single phase, grounded three-wire two-phase, and grounded open-star three-phase connections are prohibited. Star connected auto transformers with grounded neutrals on three-phase lines in parallels must also have low-impedance, delta-connected windings, or other equivalent means of suppressing triple harmonic residuals. (d) Auxiliary devices to prevent distortion of the waves by rectifiers, etc., are to be installed where necessary. (e) One oil switch with poles mechanically interconnected for simultaneous operation is required between a parallel and the source of supply of the power line to operate automatically in case of abnormal conditions, except where an operator is on duty. Consideration is to be given to switching arrangements to minimize transients. Where air-break or single-pole oil switches cause trouble, oil-switches with poles interconnected are to be used. (f) Fuses are to be avoided for main lines in parallels. (g) Electrolytic lightning arresters are to be equipped to minimize their disturbing effects. (h) Indicating devices are to be provided at supply stations to give warning of abnormal conditions, and ammeters are to be installed in important neutral-ground connections. (i) Apparatus for metallic communication circuits is to be well balanced.

The sixth, and last, section, is entitled: "Operation and Maintenance," and requires: (a) All reasonable care by power and communication interests to minimize interference and, in particular: (b) Prevention of mechanical and electrical failures which would cause or promote transient disturbances and unbalanced loads. (c) Daily record of current in

(Continued on page 31)

Canadian Waters and Water Powers

Report of Commission of Conservation on Progress of Last Twelve Months' Work—B.C. Data Soon Available

We have now practically completed the preliminary survey of the water-powers of Canada. The results have been published with respect to every province except British Columbia, and the report for that province is in the printer's hands. During the past year, special efforts were made to secure detailed information with regard to electric power plants and systems throughout the Dominion. It is of great practical importance in a country where advances are so quickly made that such information should be accurate and up to date. The report which is now in progress will completely cover this branch of the subject. The members of the staff who are specially charged with the branches of the work will give their reports to the Commission in detail, and it is not necessary for me to anticipate what they will say. I purpose, however, saying a few words on the general features of the subject of hydro-electric power.

Power Progress in Ontario

The development of hydro-electric power in Canada, and especially in the provinces of Ontario and Quebec, during the last ten years has been almost incredible. At the beginning of the work of the Ontario Hydro-electric Power Commission, the late Premier, Sir James Whitney, stated that the Commission would not require so much as 10,000 h.p. At this moment, the immediate requirements of the Hydro-electric Power Commission in Ontario may be conservatively stated at 296,000 h.p., upon which demand there is a present shortage of about 70,000 h.p. A conservative estimate of the amount of power actually in use in the city of Montreal and its environs, is 225,000 h.p. The position with respect to the province of Ontario, and especially with regard to Niagara Falls, is one which should be considered with great care. At the present time, the Hydro-electric Power Commission is about 70,000 h.p. short, and it is not too much to say that this shortage will very rapidly increase. I understand that Sir Henry Drayton has reported to the Federal Government that it is not practicable to withdraw this 70,000 h.p., which is presently in demand, from the United States, to which it is now being exported, for the reason that the power is necessary for the use of plants which are producing essential war material for Great Britain and her allies. The position is, therefore, that whereas 12 or 15 years ago, it was not thought that the Hydro-electric Power Commission could make use of 10,000 h.p., and, accordingly, permits to export were more or less freely given, there is now, in round figures, an immediate demand for 300,000 h.p., and the demand cannot be satisfied.

St. Lawrence Power Situation

A situation analogous to that in which Niagara power stood fifteen years ago, now exists on the St. Lawrence River. A very large capacity for the development of power exists upon the St. Lawrence. There is a considerable development in the neighbourhood of Montreal, but the greater portion of the power still remains undeveloped. Attempts are constantly being made to fatally complicate the position with respect to St. Lawrence power by securing the privilege of private development, which will be followed by contracts for the exportation of the power developed. I understand that the Cedars Rapids company exports something like 60,000 h.p. per annum. An attempt was made some years ago to secure the privilege of developing the Long Sault power, the purpose being to export the greater portion of the power in the interest of a manufacturing corporation on the United States side of the line. This project was defeated, largely through our efforts. A similar project is now being promoted, and we are resisting it with all our energy and we trust with fair prospects of success. It is almost incredible that any responsible man should be so short-sighted as to favor this project in the face of the experience which we are now undergoing at Niagara.

International Development Proposed

Within a very few years, there will be a demand for every horse-power that can be developed on the St. Lawrence River to which Canada is entitled for use upon the Canadian side. The situation with regard to Niagara will undoubtedly be duplicated, and if we are foolish enough to allow vested interests to be created upon the other side of the line, we shall inevitably find ourselves handicapped and embarrassed as we now are with respect to Niagara power. For myself, I have no doubt at all what ought to be done with respect to the great powers dormant in the St. Lawrence River. The United States Government is not interested in the corporations that are endeavoring to get possession of the St. Lawrence powers from the other side. Neither is the Canadian Government interested in the fortunes of the gentlemen who are promoting their projects on the Canadian side. They are very few in number, and their interests are confined entirely to themselves. What the United States Government and the Canadian Government alike are interested in is that there should be a fair division of this power, that it should be developed in such a way that the neighboring and tributary population should have the use of it upon fair terms. A thorough study of the whole question inevitably leads to the conclusion that there is only one sound and satisfactory method of developing these powers, and that is by an international commission, under which the greatest and the best use of the powers will be made, the most economical development will be effected, a just and equitable division of the power will take place and the governments concerned will be able to administer the power as the Hydro-electric Power Commission administer the power of Niagara for the benefit of the people who are directly concerned in its use.

Not Public Ownership

This bold and progressive policy, if adopted by the government of Canada, will undoubtedly command the support of our people. It is not a case of advocating what is generally described as public or government ownership. We have here a peculiar set of circumstances giving rise to a problem that is capable of being solved in only one way, and common sense indicates that we should solve it in that manner.

A Word of Warning

Let me on this point add a word of warning. The institution of this Commission of Conservation arose as one of the consequences of a conference which was called by Mr. Roosevelt, then President of the United States, at Washington, some time ago. At or about that time, Mr. Roosevelt pointed out in prophetic language how the people of the United States were being threatened with a water power

unflinchingly, and to the best of his ability he projected methods of resisting the efforts which were being made to bring about that monopoly. Since that time, water-powers have been monopolized in the United States to an extent that is almost incredible. I am not at the moment able to give the exact figures, but I think that when the real figures are known, revealing the extent to which the available and easily developed water-powers of the United States have been monopolized by a very few corporations, the people of that country will suffer a shock such as they have never experienced before with regard to the transaction of any of their public business. It has become very plain within the last few years that hydro-electric power is the greatest of all factors in modern industry, and where any people endowed by nature with a vast supply of this essential element in modern manufacture, allow to be monopolized and controlled in private interests a sad awakening awaits them.

Danger of Monopoly

Fortunately in the Dominion of Canada, we got down to serious business in time, and there has been no serious monopolization of great powers. While large powers have been developed by private companies, they have served a very useful purpose, and, in most cases, their rates have been reasonable. A serious danger, however, would arise, if, at that stage of development which we are now entering, these companies were allowed to combine their interests and, by acquiring a few great powers which are easily accessible, to institute a monopoly. This would be the most serious of all mistakes and must be prevented at any cost.

With respect, specifically, to the application which is now before the Minister of Public Works for leave to dam the St. Lawrence River at the Coteau Rapids, I purpose suggesting that our Committee on Waters and Water-powers should give the matter attention and, if possible, wait upon the Minister of Public Works and the Prime Minister to emphasize the protest which has already been lodged.

Government Water Conservation Undertakings

With respect to the conservation of water-powers generally, I am able to note several enterprises of great practical importance which show that progressive policies are being carried into effect.

Ottawa River Storage

Over half a century ago, it was urged that the construction of dams on the upper Ottawa would be of great benefit to power users at the Chaudiere Falls, Ottawa. Between 1904 and 1908, detailed surveys of the proposed Georgian Bay Ship Canal via the Ottawa, Mattawa and French rivers were made. These surveys demonstrated the value of conservation dams at several points, notably at the outlets of Lake Timiskaming, Kipawa Lake and Lac des Quinze. The con-

The German Standard of Warfare

THIS remarkable illustration is the reproduction of an actual photograph taken "Somewhere in France" by an aviator, who has since been killed in action. The Germans had surrendered and were advancing under the white flag, when suddenly the front line threw themselves on the ground (note the white flag) and the entire company opened fire on the British. The original photo was very small in size and the enlargement has resulted in some blurring of the features, but nevertheless, a close study, with a magnifying glass, if one is available, reveals the brutal gloating with which the Huns are contemplating the success of their treachery. The photographer was just on the point of "snapping" the surrender, which accounts for his securing a picture that, under other conditions, would have been impossible. It is a vivid portrayal of the type of enemy our boys are up against and the unflinching courage with which they are facing death.

struction of the three dams mentioned was completed in 1915 and the water-power interests have been much benefited by their operation, particularly during the winter of 1916-17, when the low-water flow was increased by letting out the storage water.

These reservoirs can supply an additional flow of 10,000 cubic feet per second, thus increasing the total power possibilities between Mattawa and Carillon by some 400,000 h.p., while at Ottawa alone, where the water is being fully utilized, the increase is approximately 30,000 h.p.

Le Loutre Dam, St. Maurice River

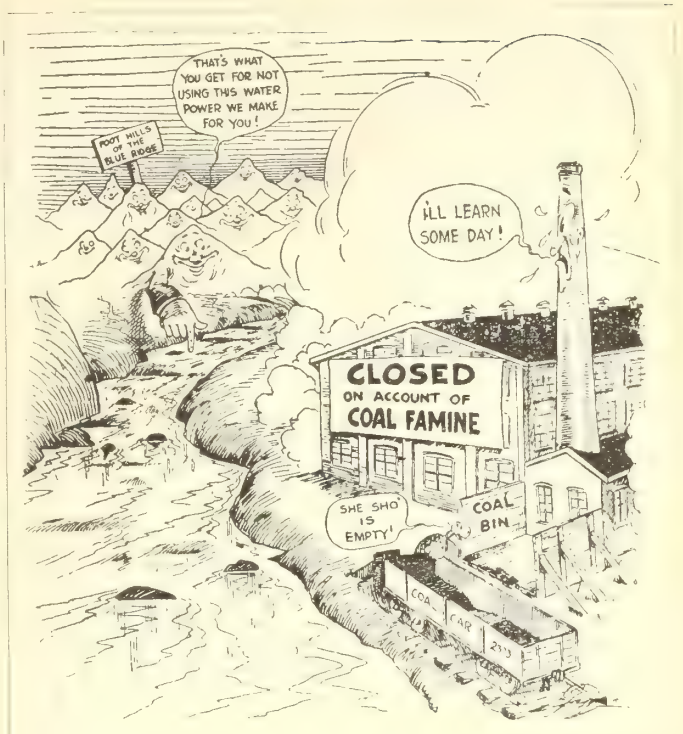
The most important water conservation work thus far undertaken in Canada is that undertaken by the Quebec Government and now nearing completion at La Loutre on the St. Maurice River. It will store up the waters of the St. Maurice for the benefit of its many water-powers and will double the low-water flow.

This work had been projected for many years, as the regulation of the river is of the greatest value to the important developed water-powers at La Tuque, Grand'mere, and Shawinigan Falls, but no construction work was undertaken. After full investigation of the project, both from the physical and financial viewpoint, the Quebec Streams Commission let the contract for construction in the summer of 1915.

The work has since progressed steadily in spite of the great difficulties in transportation. It is now 80 per cent. completed and will cost about $1,500,000. When finished it will create a reservoir of 160,000 million cubic feet, forming the third largest artificial reservoir in the world, being exceeded only by the Assuan reservoir on the Nile and the Gatun Lake on the Panama Canal. From the owners of the power-sites already developed, the Commission will receive a revenue of upwards of $130,000 per annum.

Between the reservoir and the mouth of the St. Maurice there are 17 power-sites with heads of from 10 feet to 150 feet. The aggregate descent at these sites totals 800 feet, but the dams erected in developing the various sites will increase this total head to 900 feet. Under present conditions, these sites have a total capacity of approximately 350,000 theoretical horse-power, but it is estimated that some 900,000 horse-power will be available when the flow is regulated from the reservoir. At Shawinigan, Grand'mere and La Tuque alone, the three sites at present utilized on the St. Maurice, the potentiality will be raised from an aggregate of some 190,000 theoretical h.p. to over 400,000 h.p.

St. Francis River Storage



Another water storage undertaking of the Quebec Streams Commission, now nearing completion, is the St. Francis River dam at the outlet of Lake St. Francis, the lake being used as a reservoir. Contracts for the construction of the work were awarded in September, 1915. As the majority of the power-sites on the St. Francis are actually developed and, as the power-owners have suffered from insufficient water for a number of years, this work will afford much-needed relief. It is estimated that revenue from the use of the conserved water will cover all overhead charges and maintenance costs.

By raising the level of the lake 15 feet, the reservoir will have a capacity of 12,200 million cubic feet, and will increase the flow at the outlet from the natural minimum of 100 cubic feet per second, to 600 cubic feet per second. The corresponding total power increase on the river will be 21,810 h.p., of which 6,000 h.p. will immediately be absorbed by the present users, while the development of the remaining sites will be greatly facilitated.

Trent River Conservation

An extensive system of small conservation reservoirs has been established in connection with the canalization of the Trent River. These serve the double purpose of supplying the canal system and supplementing the minimum flow in the river for power purposes. There are four hydro-electric plants on this river supplying the Central Ontario system of the Ontario Hydro-electric Power Commission and these are benefitted by the regulated flow in the river. Some of these plants have a capacity as high as 8,000 h.p.

Dams have been built at the outlet of many lakes on tributary streams and the water is stored until required in the dry summer and autumn for navigation and power purposes. The control of the flow is being constantly improved by the further utilization to the fullest extent of the natural storage basins of the Trent Valley.

—From "Atlanta Constitution"

Factories closed—Ample power going to waste.

Grand River Valley

It has for some years been a matter of public knowledge that the Grand River valley in the province of Ontario is suffering more and more from a diminished flow in that river. I am not able to give an expert opinion upon the subject from an engineering standpoint, but it seems clear that the time has arrived when the Ontario Government should make a thorough scientific examination of the subject with a view to ascertaining whether conservation works can be constructed which will remedy the evil.

Directory of Natural Resources

When the Commission was organized, one of the first tasks that we set before ourselves was the preparation of an adequate and satisfactory directory of natural resources. It very soon became evident, however, that such a directory would have been fragmentary and unsatisfactory in many respects and that much information which it ought to contain was not at that time available. The researches and investigations of the past years have now put us in a position to realize the intention which has been entertained from the beginning and which, indeed, was one of the objects we had in view at the inception of the Commission's work. We shall, therefore, proceed now without further delay and undertake the preparation of such a directory and inventory of the natural resources of Canada as will satisfy the lack which has so long existed.

Electricity for Clay-Working Plants

Special Power Requirements of Clay Products Factories and Application of Motors to Meet These—Paper before C.N.C.P.A.

By Kenneth C. Berney*

Some years ago it was the general custom to drive the machinery in clay-working plants by means of steam engines. Some of the smaller plants were operated by horse-power. Now a large number of the plants, both large and small, in localities where electricity is available, are operated by electric motors.

In some plants electrical operation begins with the digging of the clay, and is used in every operation, including hauling the shale, dumping the cars, grinding, conveying, mixing, forming the product, and conveying the finished product.

We will now discuss briefly the advantages of electric motor drive over steam engine or drive from a central plant.

In contemplation of the layout of a brick, tile, or pottery plant the first point of consideration is the location. Railroad facilities, water, coal, and location of raw material are very important factors. The use of electricity, especially when supplied by central stations, simplifies the problem since the water and coal questions become of secondary importance.

Flexibility of Electric Drive

With electric drive the various departments of the plant can be located and arranged to the best advantage for operating without the limitation of arrangements imposed by central engine drive with the accompanying belt connections to the various departments.

With central steam engine drive there must be used long line shafts and belts. If it is desired to operate only one machine or department in the plant, all of this shafting and belting must be run, which means a large friction load. In such cases this power lost in friction may equal or exceed that used in doing useful work. Not only is the cost of such waste power a big item, but the wear on the belts, shafts, and bearings is considerable. Where there is fine clay dust in the air this wear is very great. The dust collects on the belts, pulleys, and works into the hanger bearings, causing belt slippage, which means decreased output, the belts must be run very tight. With individual motor drive made economically possible by using electric motors, energy is required only when useful work is being done. The control of any one machine is conveniently at the hand of the operator, and the machine can be started and stopped at will. There is no cost for power after the machine is shut down, as would occur were long lines of belting and shafting used.

In plants where there is excessive clay dust in the air electric motors can be direct connected or geared to the driven machines, doing away with belt trouble entirely.

Greater Assurance of Continuous Operation

When the various machines or departments are operated by means of individual motors there is a greater assurance of continuous operation as compared with central engine drive, in which case engine trouble means the shut-down of the whole plant. Motors maintain a practically constant speed throughout their operating range, which results in increased production over the plant driven by a single steam engine where the speed varies not only with the boiler pressure but also with the variation in load.

Electric motors can be placed wherever convenient on the ceiling, on a side wall, on the floor, or right on the machine to be driven, and the machines can be located to best serve the logical sequence of operations. The flexibility of a motor system is also of the greatest advantage, since frequent changes in the positions of the machines and additions to the equipment are often necessary. When motors are used they can be shifted with ease. All that is necessary is to run feeders to the new location. New machines can be added to any part of the plant without fear of overloading the engine, as in the case of central engine drive.

Due to the fact that motors can be applied at the closest position to the driven machines, belts, gears, etc., are reduced to a minimum. The absence of many shafts, belts, and pulleys means that the plant will be lighter and cleaner, allowing more and better work to be done.

Fuses or circuit-breakers are installed in the motor circuit as a protection against heavy overloads such as might occur if a machine became clogged with clay. In such a case the current is cut off from the motor, and it stops preventing any damage to it or the driven machine. The possibility of a shut-down due to a machine breaking is thus reduced to a minimum.

Clay-working machines may be driven by either direct current or alternating current motors. If a plant generates its own power or is right near the central station, direct current may be used for its operation. Due to the fact that direct current cannot be transmitted long distances economically and alternating current can, practically the only current supplied to-day by central stations to power users is alternating current.

Two Main Types of Motors

So we will deal with the alternating current motor as it is used almost exclusively for industrial drive. There are two main types of polyphase alternating current motors used for manufacturing purposes—the synchronous motor and the induction motor. The synchronous motor is often used to drive machines requiring, say, 200 horse-power or more where the starting conditions are light, where the starting current is not objectionable, and where only one speed of operation is desired. If overloaded more than about 50 per cent., or the voltage at the motor terminals allowed to drop more than about 10 per cent., a synchronous motor will stop.

The induction motor is used to drive such machines as required in clay-working plants, so we can confine our remarks to this type of motor.

The induction motor consists essentially of a stationary part, at either end of which is a bracket supporting a bearing. The shaft which rotates in these bearings has mounted on it a rotating member. The clearance between the rotating and stationary parts is small, being less than 1/16 in. in a 50 h.p. motor. There is no electrical connection between rotating and stationary parts, and there are few parts to get out of repair. The induction motor is the most rugged type of electric motor made.

There are two main types of polyphase induction motors —that having a squirrel cage rotor and that having a wound rotor. They are commonly called the squirrel cage motor and the wound rotor or slip-ring motor. The rotor, as the name implies, is the revolving part. The stator, or stationary part, is practically the same in both types of motor.

Squirrel-Cage Motor Generally Preferable

The squirrel cage rotor derives its name from the fact that its winding resembles in appearance the rotating wheel

* Canadian Westinghouse Co., Hamilton, Ont.

found in a squirrel's cage. The winding consists of two heavy copper or alloy rings, which are held in place by bars, usually made of copper, which span the space between the rings at regular intervals. The ends of these bars may be riveted, bolted, or welded to the two rings. The rotor of a wound rotor motor has on it a winding similar to the stationary part, consisting of many turns of insulated copper wire. The leads from the different phases of the winding are brought out to three collector rings, on which slide the carbon brushes which carry the rotor current to the external resistance which is used with this type of motor. The collector rings are often called slip rings, from which comes the name slip-ring motor. The squirrel cage rotor is more rugged than the wound rotor, and there are less parts to get out of repair. The squirrel cage rotor is practically indestructible on motors of the latest type where the rotor bars are welded to the two rings, which are called resistance rings. A squirrel cage motor is considerably cheaper to buy than a wound rotor motor. So, everything considered, the squirrel cage motor should be chosen rather than the wound rotor or slip ring motor, except in a few applications where the latter is particularly suitable.

Where it is desired to have a motor operate at a number of different speeds the wound rotor motor is used. It is very often used where the torque required to start a load is very great. This is particularly true where the power plant supplying the current is of limited capacity, as less current will be drawn from the line at start than were a squirrel cage motor used. The wound rotor motor in a clay plant is sometimes used to drive the dry pans, pug mills, and auger machines. When squirrel cage motors are used with these machines motors with large starting torque should be applied, unless there is a clutch between the motors and the machines. Wound rotor motors should not be used where there is stone dust in the air unless the collector rings are closed in, as such dust, getting between the brushes and rings, rapidly wears the collector rings. Squirrel cage motors can be supplied suitable for driving all the machines used in clay-working plants.

Characteristics of Induction Motors

A few of the characteristics of an induction motor which may be of interest are as follows:

1. It will carry a load for short periods of two to two and a half times full load without injuring the motor and without the motor stopping.

2. The speed of the motor will be practically constant from approximately 50 per cent. load to 50 per cent. overload.

3. The motor will start a load where the starting torque required is considerably greater than the running torque. The motor can be designed with a starting torque up to two and a half times the running torque where desired for heavy starting service.

4. The current taken by the motor when starting will be approximately two to five times that required when running. It depends on the load to be started.

5. If the voltage at the motor terminals drops below normal the starting torque will decrease as the square of the terminal voltage divided by the normal voltage.

In applying electric motors to clay-working machinery the following severe conditions must be kept in mind:

1. Severe starting requirements, due to the inertia of the driven machinery and to material in the machinery hardening when at rest.

2. Severe overloads, due to irregular feed of material.

3. Dusty atmosphere about plants and presence of dampness, causing collected dust on the motors to become cemented to the windings and interfering with ventilation.

4. The use of gears of large pitch and high pitch line speeds, resulting in severe vibrations.

Good service is obtained with these conditions only when careful consideration is given to the application to each individual machine. The motors in clay plants should have generous starting and running characteristics, the bearings made dust-proof, and the windings impregnated to withstand moisture. The motors should be carefully aligned with the driven machines. The feeders to the motors should be of ample size to carry the current, bearing in mind that motors which drive machines hard to start will draw much heavier currents than those driving machines easy to start. If the feeders are too small the terminal voltage will be lowered, with consequent decrease in starting torque.

To provide for the severe starting and running conditions there has been a tendency to select motors larger than necessary. The result of the low load factor caused thereby is low power factor and low efficiency of the individual motors. On account of low efficiency the cost of electric power will be greater. This cost will still be increased if there is a penalty for low power factor. The best plan is to consult the manufacturer who can supply a motor just large enough to do the required work, and with large starting torque where such is required. In case of machines hard to start, a standard squirrel motor can be used in combination with a friction cluth and the motor started without load. Friction clutches, however, are subject to wear, and should be avoided wherever possible.

Consideration must be given as to whether group or individual drive of machinery would be better. For plants with storage facilities between the various departments and the machinery scattered individual drive will usually be better, while for plants with all machinery inter-dependent and grouped group drive will be better.

The following are usual drives employed for the more common machinery found in clay plants:

1. The conveyor from the storage bin is usually belted from the motor driving the crusher or dry pan.

2. Crushers are usually belted to the motors. Motors with good starting and pull-out torques are required with all kinds of crushing machinery.

3. Dry pans are usually driven by motors geared to the dry pan shafts. The vibrations of these machines are severe, and the motor shafts should be supported by outboard bearings. An improved arrangement is to have flexible couplings between the gearing and the motors, as this prevents the transmission of vibrations to the motors to a large extent.

4. The pug mill and auger machines may be driven by motors, either belted or geared to them. Because of the large pitch of the gears of these machines considerable vibration results, and flexible couplings should be used if the motors are geared. These machines are sometimes stopped full of material, which hardens if the shut-down is of an appreciable length, and, if clutches are not provided, the starting requirements of the motors are severe. For such installations wound rotor motors are advisable.

5. The cutters, represses, elevators, and conveyors between the various machines require little power, and may be driven from the motors driving the machines upon whose operation they are dependent, or individually by small motors.

We will now briefly outline the motor drive in various kinds of modern clay-working plants. First, we will touch on the most common of all—the brick plant.

Brick Plants

There are three common forms of brick plants, depending on what kind of machinery is used to form the brick. There are the "stiff mud," the "soft mud," and the "dry mud" machines.

In case the raw material used is shale or rock, crushers or dry pans are usually used, while for soft and stiff mud, refining rolls or various kinds of pulverizers are used.

First, we will take a plant with a capacity of approxi-

mately 60,000 building bricks an eight-hour day. Both common and face brick are made from hard shale. This plant is the type where "stiff mud" machines are used, forcing the clay through dyes by an auger machine into a continuous bar, which is cut into bricks by parallel wires or by an automatic cutter. In this plant the air is drawn from the kilns containing the burned brick during the cooling period and passed through drying tunnels containing the green brick, drying the same. When it is desired to move the dried brick the hot air is shut off and the air in the tunnels is cooled by an exhaust fan. Squirrel-cage motors, two-phase, 220 volts, 60 cycle, are employed for the entire operation of the plant. The total motor capacity is 215 h.p. and the maximum demand is 130 h.p.:—

One 40 h.p.,; 850 r.p.m. Drive—Geared to and belted. Application—9 ft. dry pan. From extension shaft of dry pan to 40 ft. bucket conveyor.

One 40 h.p.; 850 r.p.m. Drive—Geared to and belted. Application—9 ft. dry pan. From extension shaft of dry pan to 40 ft. bucket conveyor and a 50 ft. x 24 in. belt conveyor.

One 40 h.p.; 850 r.p.m. Drive—Geared. Application—To an American No. 51 pug mill.

One 75 h.p.; 690 r.p.m. Drive—Geared and belted. Application—To No. 1 giant brick auger. From countershaft of brick augur to 30 ft. shaft, whch drives an 18-brick automatic cutter, three belt conveyors, a bucket conveyor, and a repress.

One 15 h.p.; 1,120 r.p.m. Drive—Belted. Application—Through countershaft to 140 in. blower; speed, 216 r.p.m., supplying draught for ovens.

Typical Drive in Common Brick Plant

Next we will take the motor drive used in a plant making common brick from soft clay which requires no screening or grinding. The daily output is 40,000 bricks. Soft mud machines, consisting of an upright receptacle with curved arms at the bottom to force the clay into press box moulds, are used. The moulds are fed automatically under a press, after being filled, and are moved forward to delivery tables.

Here one 60 h.p., 690 r.p.m., induction motor is used. It is belted by means of main shaft and countershaft to one combination pug mill and brick press, capacity 120 bricks per minute; one mould sander and one waste clay elevator to lift waste clay from brick machine to pug mill. The brick are air-dried, and cordwood is used to fire the kilns.

Lastly, we will consider the motor drive in a plant manufacturing pressed brick from a hard shale where the "dry machine" process is used. In this plant there are two separate and distinct units, each unit being driven by a 50 h.p. squirrel-cage motor. Each 50 h.p. motor is belted to a 9 ft dry pan and a brick press, as well as the necessary conveyors, cup elevators, etc. The moisture is added to the material in the dry pan, and the material is fairly dry when pressed. The kilns of this plant are fired with cordwood. Each unit is capable of turning out approximately 23,000 bricks an eight-hour day. When a large output is required both units can be run, giving an output of 46,000 bricks a day. Under this arrangement the plant is always run at high efficiency, and one unit is in reserve in case of any breakdown in the other unit.

A plant manufacturing ordinary drainage tile will have the same motor equipment as a brick plant. In fact, tile is often made in a brick plant by simply changing the dies on the auger machine so that the clay will be forced out in the form of a tube, whch is cut into the required lengths.

Sewer Pipe Plants

In a certain sewer pipe plant there is in use, or will be shortly, a total of approximately 235 h.p. in squirrel-cage induction motors. The raw material used is a weathered shale, which is brought to the plant by railroad. The shale is conveyed from the receiving platform and elevated to the storage room by means of two 5 h.p. motors, one operating the conveyor and one the elevator. The shale is first fed into a dry pan, which, along with the conveying belt and elevating cups, is driven by a 75 h.p. motor, belted to the load. From the dry pan the material is carried to the wet pans, three in number, where it is uniformly mixed. It is then conveyed by belts and elevators to the presses, where it is pressed into moulds, making the different size of sewer pipe, one length at a time. Special shapes of pipe are hand-moulded. The three wet pans and the conveyor belts are belt-driven by a 150 h.p. motor. The moulded pipe, after drying, is put in permanent kilns, which are fired by coal. The glazing of the pipe is done during the latter part of the firing.

Pottery and Ornamental Tile Plants

Here the nature of the work is such that individual motor drive offers many advantages. The use of belts and line shafting in factories of this type is especially disadvantageous on account of the fine clay powder which fills the air and collects on belts and pulleys, producing excessive belt slippage and large friction losses. The output of the plant is, in many cases, limited on account of the belt slippages. The use of individual motor drive will, in such cases, increase the output of the factory without any other increase in factory equipment, extra floor space, or labor.

In pottery and tile plants the charge, consisting of flint, feldspar and clay, is thoroughly mixed with water in a "blunger" mill. The "slip" is then sifted to remove lumps into an "agitator." Then the slip is pumped into a slip press, where the greater part of the water is pressed out. The wet clay, which is uniform in composition and free from lumps, is taken from the slip press. Up to this point the method of manufacturing pottery and ornamental tile is the same. For pottery the wet clay is pressed through a pug mill to distribute the moisture evenly and is then moulded into finished shape on "jigger" machines. For tile the wet clay is dried in racks and then passed through a crusher. After this it is ground into a fine powder in the dust mills. The fine, dry powder is then moulded into forms by presses, after which it is ready for the initial firing. The firing of the ware is practically the same in both cases. After initial firing the ware is decorated, refired, and glazed. Pottery is dipped entirely into the glaze and the tile is glazed on one side only. The ware is again fired, which completes its manufacture.

Some of the motor drives used in an ornamental tile and pottery plant are as follows. Sixty cycle squirrel-cage motors are used:

10 h.p.; 1,120 r.p.m. Drive—Geared. Application—Two double blungers.

3 h.p.; 1,120 r.p.m. Drive—Geared. Application—Sifters.

3 h.p.; 850 r.p.m. Drive—Geared. Application—Agitators.

5 h.p.; 1,120 r.p.m. Drive—Geared. Application—Slip pumps.

20 h.p.; 1,120 r.p.m. Drive—Direct connected. Application—Dust mill.

7½ h.p.; 850 r.p.m. Drive—Geared. Application—Pug mill.

15 h.p.; 690 r.p.m. Drive—Belted. Application—To several glaze machines.

An electric motor is also geared to a "grogg" pan, which crushes the broken sagars.

Porcelain Insulator Plants

Porcelain insulators which are made from "Kaolin," clay, and quartz, are manufactured much the same as pottery. The wet clay may be moulded in metal dies or on "giggers" for "petticoat" insulators, or forced through a tube machine in the shape of tubes or cylinders for tubes and bushings. The

moulded pieces are thoroughly dried, then dipped in a glaze, which has been made the desired color, and again dried. This glaze has the same coefficient of expansion as the porcelain, and has no constituents to deteriorate. The insulators are fired in kilns, which are raised to a very high temperature for a few hours and then allowed to cool down slowly. Porcelain insulators must not only stand high voltages in many cases, but at times heavy mechanical strains.

In a certain electrical porcelain insulator works located in this part of the country there is a good example of individual motor drive. The principal machines are driven by 19 squirrel-cage motors, with a total capacity of 84 h.p. The motors are belted to the driven machines.

Blunger and agitators	1—10	h.p. motor
Pug mill	1—10	"
Large centre machine	1—15	"
Small centre machine	1— 7½	"
Clay lathes	1— 2	"
Giggers	2— 1	"
Finishing machines	6— ½	"
Grinding machines	1— 2	"
Glaze mill	1— 7	"
Grogg pan	1— 7½	"
Air compressor	1— 8	"
Water pump	1— 5	"
Machine shop line shafting	1— 5	"
	19	84 h.p.

The kilns in this plant are fired with coal.

One of the points of consideration in changing over from steam to electric drive is the method of drying the product. In those plants where heat exhausted from the kilns is used for drying or where drying tunnels are heated directly by coal or gas no change is necessary.

Scientific and Industrial Research Council Holds Meeting

The Scientific and Industrial Research Council held a meeting at Ottawa at the close of last week, at which a number of important questions connected with Canadian industries were considered. A memorandum was forwarded to the government urging immediate action to make available the varied fuel resources within the boundaries of the Dominion for the use of the people of Canada in the coming year and placing the services of the Research Council at the disposal of the government to that end.

A grant was made for the purpose of carrying out an investigation on the utilization of the immense quantity of sulphite liquor which is now thrown away as a waste product by the pulp mills of Canada with a view to the establishment of certain new industries with this material as a raw product. The utilization of the waste ammoniacal liquor from Canadian gas works was also considered, this product containing large quantities of ammonia, which is of great value as a fertilizer.

Standardization of Engineering Products

The council, at the request of the Institute of Civil Engineers of Great Britain, also took steps to bring before the government and certain manufacturers of Canada the importance of Canada associating itself with the movement which has recently been organized in Great Britain, the United States, and France for combined action in connection with the standardization of various engineering products used and exported from these countries. This is a matter of great importance in connection with the building up of an export trade in this class of products by Canada at the close of the war. Connected with this the council is investigating a number of other questions which have been submitted to it dealing with post-war conditions with which our Canadian industries will be brought face to face upon the declaration of peace.

It was decided also to approach the Canadian Manufacturers' Association on the question of the development of trade organizations for the promotion of research, etc., in connection with groups of industries, such organizations having been developed with most beneficial results in Great Britain and in the United States. Co-operation along these lines is of the highest importance if Canada is to be able to hold her own in the keen competition which will develop in foreign markets with the cessation of hostilities.

The council decided to issue to the public a series of short bulletins dealing with some of the more important questions regarding the raw materials and certain manufacturing problems concerning which enquiries are being made at the present time.

Conservation of Fishery Resources

The council, in conjunction with the Biological Board of Canada, at a previous meeting, considered carefully the representations which had been made to it by the British Columbia canners' organizations and by private parties in that province on the subject of the preservation of the sockeye salmon of the Fraser River, the most important of the food fishes in British Columbia waters, and came to the conclusion that unless measures are taken very speedily the sockeye will soon be exterminated. The chief factors in this are the over-fishing of the sockeye and the obstructions that are offered to its ascent of the Fraser River to its spawning grounds in the upper reaches of that river. The first-named factor is by far the most important in this process of extermination, and it concerns international waters, through which the fish proceed from the entrance of the Strait of St. Juan de Fuca to the mouth of the Fraser River. Through the extremely large number of nets of all descriptions employed in these waters during the fishing season it is impossible for all but a minute percentage of these fish to reach their spawning grounds.

Resolution

On this subject the council passed the following resolution, which was communicated to the Minister of Marine and Fisheries:

"The Research Council and the Biological Board of Canada unite in recommending that the Dominion Government take steps to arrange a convention with the Government of the United States looking towards the appointment of an international commission which shall have the control of the salmon fisheries of the Fraser River and of all those waters through which the fish pass to reach the Fraser River, this commission to have full power to make and enforce regulations for the effective conservation and the restoration of these fisheries."

The international commission, as suggested, would have powers similar to those of the International Waterways Commission, appointed by the governments of Canada and the United States. This, in the opinion of both the Research Council and the Biological Board, is the only way in which the sockeye salmon can be preserved and the canning industry of British Columbia continued.

Report on Inductive Interference

(Continued from page 24)

grounded neutrals of important stations. (d) Transformers are not to be operated at more than specified percentages above normal voltage. (e) Care shall be exercised to avoid switching disturbances. (f) Where lightning arrester charging disturbs, it should be done in the early morning. (g) A definite procedure shall be provided for station operators during times of abnormal unbalance on power lines involved in parallels. In general, the section of a faulty line passing a parallel should be disconnected until cleared, and not energized more than once in locating the fault. To facilitate the study of such cases, accurate records are to be kept of occurrences under abnormal conditions.

Electricity as Fuel Saver in Iron and Steel Trades

By A. H. Marshall, before I. E. E.

I purpose to take as a subject of general interest, the use of electricity and its bearing on fuel saving in the iron and steel trades. With these trades the electrical industry will be associated for its greatest development in the immediate future. The war has given a great impetus to steel production, and in the period immediately after the war there seems to be every probability that the steel trade will continue to flourish. Up to quite recent times the mining of coal and ore, coking, smelting, steel making and rolling have all been more or less separate undertakings. There is every indication that the next few years will see a greater combination of interests, better application of capital and the utilization of every means to economy.

With efficient plant and means for the recovery of surplus heat, it is commercially possible to meet all the heat and power requirements of a works that is laid out complete with coke ovens, blast furnaces, steel furnaces, and mills from the combustion of the coal fed into the coke ovens, without burning any coal in producers for the steel furnaces or in boilers for any portion of the power plant. This is an ideal arrangement. It has not been attained, because even the largest undertakings, although they can be made self complete under normal operating conditions, have not been able either to safely dispense with their coal-fired heating plant, or to justify the capital expenditure necessary to make full use of their waste energy. Yet that such an economical arrangement is attainable is evident if one applies the advantages of linking up to the electrical end.

Distribution of Coal Energy

I propose to put a few figures before you to show you how the energy of the coal, as fed to the coke ovens, is distributed in the process of coking, smelting, and steel making.

In the following data in Table I., the heat available at each stage is expressed in terms of one ton of coal carbonized, and the products are those which correspond therewith. The energy values are given in kilowatt hours or kelvins, the latter being the better term, seeing that both heat and electricity are being measured.

I am dealing with the conditions of iron and steel manufacture on the North-East Coast, and have taken as a basis, one ton of ordinary Durham coking coal having a value of 12,500 B.Th.U.

One ton of coal produces 0.7 tons of coke, together with the other items shown, the heat values of which are given in the first set of figures. Now 0.7 ton of coke will smelt 0.64 ton of pig iron, and the 6,000 units of heat energy in the coke is distributed as shown in the second set of figures. Of the surplus gas, viz., 630 units at the coke ovens, and 2,160 at the blast furnaces or 2,790 in all, about 1,200 can be made use of on the open hearth converters, and 390 in reheating the steel ingots.

The heat available for conversion to electrical energy or mechanical power consists of 350 units from the tar, 650 from the slag, 300 which can be recovered as waste heat from the steel furnaces, and surplus gas to the value of 1,200 or 2,500 in all. These units of heat energy converted at a thermal efficiency of 15 per cent. yield 280 units, and this on a coal consumption of 50 tons per hour, corresponds to an output of 14,000 kw.

Let us take the case of a group of works equipped with four 70-oven batteries consuming 8,700 tons of coal per week, five blast furnaces, each making 1,100 tons of pig per week, and sufficient open hearth steel furnace capacity and rolling mill plant to convert the whole of the pig iron make into finished steel sections. Eight thousand seven hundred tons of coal per week at a steady rate of consumption is approximately 50 tons per hour.

Table I.—Distribution of Energy in 1 ton of Coal (12,500 B.Th.U. per lb.) Containing 8,200 kw.-hours

Quantity of product		B.Th.U.	Kw.-hours available for conversion to power.
Carbonizing 1 ton of Coal			
5,500 cu. ft.	Gas used on ovens	690	...
5,000 cu. ft.	Gas surplus	630	...
0.7 ton	Coke	6,000	...
0.05 ton	Coke breeze	300	...
100 lb.	Tar	470	350
2½ gallons	Benzol	110	...
		8,200	
Smelting 0.64 ton of Pig Iron:			
31,700 cu. ft.	Gas used on stoves	930	...
73,800 cu. ft.	Gas surplus	2,160	...
1 ton	Slag (sensible heat)	650	650
0.64 ton	Pig iron (sensible heat)	250	...
	Furnace reaction and loss	2,010	...
		6,000	
Utilization of Surplus Gas from Coke Ovens and Blast Furnaces:			
	Making steel (0.68 ton)	1,200	300
	Re-heating ingots (0.68 ton)	390	...
	Balance	1,200	1,200
		2,790	2,500
Conversion to Electrical or Mechanical Power:			
	Total available energy		2,500
	Less slag value		650
			1,850

Thermal efficiency 15 per cent.
1,850 × 0.15 = 280 kw.-hours per ton of coal.

On the other side of the account the power consumed at the works would be as shown in Table II. The blowing plant requirements are based on 4½ tons of air per ton of coke, equivalent to 138,000 cubic feet per ton of pig iron; theoretically it needs 1 kw. to deliver 1,600 cubic feet of free air per hour under the usual conditions of temperature and pressure which, at a blower efficiency of 72 per cent., comes out to 120 units per ton of pig iron. For the rolling mills I have taken 110 units per ton of steel.

Table II.

Kilowatts Output:	
Coal consumed per hour	50 tons
Electrical energy per ton of coal	280 kw.-hr.
Nominal output, 280 x 50	14,000 kw.
Minimum output, 14,000 x 0.6	8,400 kw.
Average output, 14,000 x 0.85	11,900 kw.

Kilowatts Load:	Units required per ton of coal	Mean kw.	Load factor	Max. kw.
Coke oven auxiliaries Blast furnace " Steel furnace "	40×50	2,000 at	0.6	3,300
Blowing plant (120×0.64)	77×50	3,800 at	0.9	4,200
Rolling mills (110×0.68)	75×50	3,700 at	0.6	6,500
		9,500		14,000
Average output units per week		11,900×168		2,000,000
Consumption " "		9,500×168		1,600,000
Surplus				400,000

The sum of the demands on this showing would be the

same as the nominal kilowatt output. One should, however, allow for a stand by supply of 40 per cent., or, say, 5,600 kw. An allowance of 15 per cent. would probably be sufficient to cover the average deficiency of the generating plant making the average output 11,900 kw., and the units per week 2,000,000, while the total consumption 9,900 × 168 = 1,600,000, leaving a surplus of 400,000 per week.

The figures given in Table I. are based on the following values, which, I think, are fairly representative:—

Gas per ton of coal coked	10,500 cu. ft.
Gas burnt on the ovens	5,500 cu. ft.
Calorific value of coke oven gas	430 B.Th.U. net.
Tar per ton of coal coked	100 lb.
Coke per ton of pig iron	22 cwt.
Gas from blast furnaces per ton of pig iron	165,000 cu. ft. 100 B.Th.U.
Calorific value of blast furnace gas	
Slag per ton of pig iron	30 cwt.
Heat required at steel furnaces per ton of ingots	6,000,000 B.Th.U.
Heat required for reheating	2,000,000 B.Th.U.

All the gas values being at normal temperature and pressure.

The coke oven results are those obtained with any well-known make of by-product regenerative oven, operated under ordinary commercial conditions. About one-half of the gas produced goes to heat the ovens, and the other half becomes available for outside use. Coke oven gas can be used for the production of power by either gas engines or boilers. It is not as suitable as producer or blast furnace gas for gas engines, because of sulphur and preignition troubles; for boiler use it gives a greater output for the same heating surface than coal. It is being largely used as fuel for steel furnaces.

The consumption of coke in the blast furnace may be taken at about 22 cwts. per ton of pig iron. The air or blast required to provide sufficient oxygen to convert the carbon (less what takes part in other reactions) into the reducing agent carbon monoxide, is about 4½ tons per ton of coke. Apart from its principal function of smelting iron, the blast furnace may be looked upon as being a large gas producer. The air for the blast is usually heated by means of brickwork stoves of the regenerative type, which makes the first call on the gas from the furnace. The stove efficiency may reach about 70 per cent. The kw. hours of heat corresponding thereto are 930, and these, added to the 2,010 units for "furnace reaction and loss," represent the quantity of heat absorbed in the smelting process.

The heating of the basic open hearth steel furnaces and mixer is commonly done by means of a simple form of gas producer, consuming about 6 cwt. of coal per ton of steel ingots, and giving off a gas having a calorific value of 130 B.Th.U. Both coke oven gas and blast furnace gas can be and are used for this purpose, the former for preference. About 6,000,000 B.Th.U. of 1,760 kw. hours per ton of steel will be required.

Waste Heat Can be Recovered

The burnt gases from the open hearth furnace leave at a temperature of about 1,100 degs. F. There is consequently a great deal of waste heat, which it is found can be recovered by fitting boilers in the flues leading to the chimney stack. About one-fourth of the heat supplied to the furnaces is available for the raising of steam.

The heat required at the soaking and reheating pits may be taken at 2,000,000 B.Th.U. per ton or 580 kw. hours.

Looking at the figures given in the table from the point of view of power production, the first available source of energy is the tar from the coke oven gas in the by-product plant. An average yield is about 100 lbs. per ton of coal carbonized, having a heat value of 500 kw. hours. Practically all metallurgical coke is now made in by-products ovens.

The 650 units available from the slag represent the sensible heat in the slag as it comes from the furnaces. So far as I know this heat has not been put to any commercial use hitherto, mainly because the gases and other sources of waste heat which are in a more usable form have not been fully exploited. It is, however, a possible source of energy.

The blast furnace gas forms by far the largest item of available heat, and its use, therefore, calls for special consideration. After the requirements of the steel plant are satisfied, there may remain 2,160 units available for power purposes. Gas engines of sizes ranging from 1,000 to 5,000 h.p. have been built for driving both blowers and generators, and a considerable number are now in use.

The whole of the blast furnace gas should be cleaned of the dust which it contains, both for heating and power purposes. Beside the frequent boiler cleanings which are necessary, the whole of the furnace plant has to stand for a day or two about every three months to permit of the flues and stoves being cleared of the great quantity of dust which accumulates. There are two systems of cleaning in vogue, one necessitating the use of a large quantity of water atomized and intimately mixed with the gas in suitable centrifugal apparatus from which the dust comes away as a sludge, and the other a filtering or dry method. Both systems rob the gas of the greater part of its sensible heat. Recently, and more particularly because of the demand for potash, consideration is now being given to an electrostatic method of dust extraction developed by Dr. Cottrell in America and used with great success.

In old-established Cleveland practice the surplus heat from the blast furnaces is converted into power by means of shell-type boilers in open settings and non-condensing steam engines at a thermal efficiency of about 5 per cent., and as a consequence there is usually little gas to spare. The advent of the exhaust steam turbine has been taken advantage of in a good many cases, improving the thermal economy by another 5 per cent. In the Middlesbrough district alone the boiler feed recovered at the power company's stations in this way exceeds 200,000,000 gallons per annum. From my own experience steam plant at the present time best fulfils the principal conditions of cost, thermal efficiency and reliability and possesses advantages over gas plant in being able to use up heat in other form than that of gas.

A 15 per cent. thermal efficiency for modern steam plant falls a great deal short of what it is possible to obtain with turbines of large size, high steam temperatures and other aids to economy, but, on the other hand, it is an advance on present practice in comparatively small stations. It is based on a boiler efficiency of 70 per cent., a steam consumption of 14 lbs. per shaft kilowatt-hour for the blowers and 12 lbs. for the 10,000 kw. sets, under ordinary commercial conditions of pressure superheat and vacuum.

Estimated Saving in Coal

There are no statistics available of the quantities of coal at present used in the several processes of iron and steel-manufacture, and I can, therefore, only make a rough estimate of the amount which would be saved with a complete system of heat recovery such as I have described. Assuming that on the average the coke oven and blast furnace gases now supply the blowing plant, the auxiliaries and one-fourth of the requirements of the rolling mills, then more coal would come into the scheme to the extent of that needed for three-quarters of the rolling mills and for the steel furnaces—an additional quantity which I would not like to put at a less figure than 11 cwt. per ton of steel, and which on last year's output would amount to about 5,500,000 tons per annum. This coal would be saved and there would still be left a surplus of energy above the works requirements.

The advantages claimed for the electrical reversing mill

have been well substantiated in practice, as is borne out by the fact that there are at the present time under construction at least seven reversing mill equipments ranging from 10,000 to 20,000 h.p. in size, capable of doing the heaviest class of work, both roughing and finishing, with outputs of over 50 tons per hour. These new mills will, together, have a capacity of well over 1,000,000 tons of steel per annum. In addition there are numerous alternating-current motor continuous mill drives being installed in sizes of from 2,000 to 10,000 h.p.

The most recent electrical development and steel works practice, and one which has received a great impetus from the war, is that of the electric furnace. It may be that the quality of steel rails, for example, produced or partly produced electrically, will be such as to command a price high enough to bear the additional cost of production. An average figure for melting and refining is 750 electrical units per ton, which may be compared with the heat absorbed by an ordinary gas-fired furnace, as shown in Table I. At this figure the mean demand would not be less than 2,600 kw., and the maximum about 3,500 kw. This addition to the mean load brings it up to 12,100, or nearly the same figure as that taken for the average output of the generating plant.

As an illustration of the scope of future electrical development, the total electrical energy to be dealt with, assuming the figures given to apply to a make of steel of 14,000,000 tons, and not counting the power taken by the blowing plant, works out at 3,300,000,000 units per annum, with a maximum load of over 600,000 kw.

Light-Weight Safety Cars the Best for All

Gives the Public Better Service, the Investor a Fair Return and the Employee Safer and Easier Working Conditions

The advent of the light-weight, quick-service safety car handled by a single operator marks a most important epoch in the development of the street railway industry. In the operation of electric railways we must recognize three factors, as follows:

1. The Public.—It is the community that gives the street railway its excuse for existence. It is their patronage that pays our bills.

2. The Investor.—It is the financier on whom we depend to furnish the capital to run our road.

3. The Employee.—It is the officers of the company—the clerks, the shopmen and the platform men— on whom the investor and the public alike depend to properly handle their investment and to sell their service.

To prove the success of the safety car we must show that the three parties referred to are benefited thereby. Likewise, the corollary is true. The benefits derived from the operation of safety cars must be divided equitably among these three parties or its success will not be assured.

To the public the safety car offers more frequent and faster service and more comfortable and safer riding. Three safety cars will displace two ordinary cars and cut the weight in two, yet provide seats for 10 per cent. more passengers. Equipped with modern motors and ball bearings on the axles, the safety car accelerates at 2½ to 3 m.p.h.p.s., or faster than the average jitneys can get started. Therefore, in actual competition with jitneys, the safety car gets away ahead of them, picks up the passengers at the next corner and is off again before the jitney can pass the car. As has been proved in jitney infested centers, the safety car has driven them off the street.

The fact that the safety car carries fewer passengers than the ordinary car simply means a reduction in the number of stops, thereby contributing to an increased schedule speed. For instance, if the schedule speed of the ordinary car were 8½ m.p.h., the safety car under the same conditions would make approximately 10½ m.p.h.—an increase of 25 per cent. The car is mounted on 24-inch wheels on an 8-foot wheelbase. Lost motion between car body and truck has been eliminated, thereby doing away with the undesirable pendulum motion of car body under rapid acceleration and braking. Furthermore, the car body is so suspended on the trucks as to provide for a natural swing or lateral movement when it takes curves or sidings. In addition to this there are a low step and cross seats, all of which contribute to the comfort of the riding public.

The safety of the passengers is cared for by automatic devices interlocked with the control of the car. Although the car is operated by one man, it is safer than a two-man car not equipped with these automatic devices. The standard safety car has straight air brakes with emergency feature. Any collision or other accident that breaks the air pipes will stop the car in emergency. Furthermore, the operator cannot leave his post unless the brakes are applied, and if he becomes incapacitated the brakes go into emergency. An emergency application may be obtained by the operator; first, by removing his hand from the controller handle (if the brakes are not already applied in service); second, by removing his foot from a foot valve (used for cutting out the emergency feature in the controller when the operator wants his left hand free to make change or issue transfers without getting an emergency application) and, third, in the usual manner by the brake valve.

An emergency application not only applies the brake with full force as quickly as air can be passed direct to the brake cylinder, but it first shuts off the power and applies sand to the rail. The use of sand on a bad rail will shorten the stop by 20 per cent. At the same time the front and rear doors are unlatched, so that they may be opened by passengers pressing against them. This is made possible by the fact that the doors are operated by air, and is one of the most important safety features of the car. Otherwise imagine the panic that would arise in case of an accident if the passengers found themselves locked in the car, as they would be if the operation of the doors were not interlocked with the control of the car.

In none of the many cities operating safety cars has the public objected to their use. On the contrary, in many ways they have evinced their approval. Whereas on a two-man car fifty per cent. of the passengers ask the conductor for change, on safety cars only 10 or 15 per cent. call for change. There is an explanation for this. Safety cars have no "riding" platform or reservoir capacity. As a result passengers unconsciously get their exact fare ready as they board the car.

On a two-man car passengers feel that the conductor is there for the sole purpose of collecting fares, and they are inclined to take their time about it. On the other hand, as passengers board a safety car they realize that the operator's primary duty is to run the car rather than collect

fares, so they feel that it is their duty not to take up any more of his time than necessary so that the car can get under way without delay. Transfers are on a rack at the side of the fare box. They are punched at the end of the run, so that no time is lost in issuing them.

The operator sits far over on the left side of the platform, thereby allowing for as much space as possible for passengers entering and leaving the car. The fact that the passengers board the car at the forward end, right at the side of the operator, enables him to "spot" his car when stopping to pick up passengers. This saves the passengers a few steps, a particularly desirable accommodation at muddy crossings. It also cuts a little time off the length of stop.

Why the Car Appeals to the Investor

To the investor, representing the capital invested in street railways, the safety car offers unusual opportunities. A 65 per cent. reduction in weight on rails means a material reduction in maintenance of track and roadway, estimated by some engineers as directly in proportion to the reduction in weight. It also means a proportionate saving in power. The saving in platform expense is more than 50 per cent., even if the operator is paid 10 per cent. more in wages than he received as a motorman. This is due to the 25 per cent. additional mileage made by the safety car. The maintenance of car and equipment is less—due to the reduction in number of wheels, motors, square feet of car surface to be cleaned and painted, etc.

Shorter headways and faster schedules encourage riding, as for instance, a 40 per cent. increase in service has occasioned a 60 per cent. increase in number of passengers. The safety car operating on a shorter headway caters to the short-haul passenger, the one that it costs the least to handle. The elimination of jitneys brought about by higher acceleration and schedule speed and more frequent service contributes largely to the increase in passenger traffic, as does also the diminution in the use of privately-owned automobiles, enhanced to some extent by war conditions. To summarize it may be said that when the cost per car-mile for operating the ordinary car is 15 cents, the cost per car-mile for the safety car is 8 cents—a saving of 7 cents. Three cents of this represents the saving in platform expense and the balance in the economies resulting from the operation of a lighter car on a faster schedule.

To the employee, particularly the platform man, the safety car also offers unusual opportunities. A greater exercise of mentality encouraged by additional responsibility is usually rewarded by a 10 per cent. increase in wages. Furthermore, the former platform man is advanced in title from a motorman or a conductor to an operator.

No man need lose his job on account of the introduction of safety cars. The change cannot be brought about rapidly enough for that. For a time, it might cause a falling off in the number of "turnovers," but during the war there is such a demand for men no objection has been raised against the safety car on account of its saving labor. On the contrary, employees like the safety car. In cities where they are being introduced there is always a long list of applications from motormen and conductors waiting to be assigned to safety-car runs.

The car is easy to operate. It is controlled by two handles, that of the controller and the brake valve. Sand may be applied in any position by pressure on the brake-valve handle. The control of the doors is also incorporated in the brake valve so that after the brake is applied the operator may open the front door by simply moving the brake-valve handle to the door-opening position. The operator is seated in a comfortable swivel chair and handles the safety car in much the same way as a chauffeur runs an automobile. The elimination of physical strains makes the operator more alert by increasing his mental efficiency. This is reflected in the reduction of accidents.

Furthermore, the ease of operation makes the safety car adaptable to the use of women operators. At this time this point is particularly worthy of consideration. As more men are called into the service, women will take their places, and it will be a long time after the war is over before they leave the various lines of endeavor that they are now entering. The economic and social fabric that is being woven by this war will not be unravelled over night.

The Car is Not an Experiment

Safety-car service is not an experiment—it is an established institution. It was on November 1, 1916, that the Summit Avenue line in Fort Worth, Tex., was changed over to safety-car operation. Since then 1,000 safety cars have been placed in service or contracted for by sixty different cities of this country. Furthermore, 98 per cent. of the one-man cars built in this country during the last two years have been the standard safety car. This fact alone should have an important bearing on the financing of new safety cars, as the question as to whether or not the proposed new cars are of a standard type is one of the first questions asked by the banker. Furthermore, it is just what the industry has been longing for—a standard car and equipment for electric street railway service.

What Can be Done Now?

What has been said so far may be good food for thought, but it does not offer immediate relief. Old equipment cannot be scrapped and replaced at once by safety cars. Furtherfore, with the government competing with private enterprises for the use of capital, there is not much of it available for the purchase of new cars and equipment. We must conserve what we have and operate it as efficiently as possible.

Undoubtedly many existing cars should be converted into safety cars and operated advantageously by one man. If the cars are too large for one man to handle during rush hours a conductor could be employed at that time. The question then arises as to what to do with him the balance of the day. Why not employ him in the shop or office? Select the work he is best fitted for and teach him how to do it and so schedule the shop and office routine as to allot certain work to these extra men. This would certainly be conserving man power to the greatest extent and would be a material benefit to the men themselves.

On the other hand, why not consider women as conductors during rush hours? There are many of them who have the time and who are willing to work on a part-time job.

The handling of factory crowds by large cars operated by one man could readily be taken care of by the prepayment method. Arrange to have the factory employees pay their fare before they enter the car. The operator could handle the additional passengers picked up en route. A car seating thirty-two to thirty-six passengers is as large a car as can be handled properly by one man when loaded to capacity.

The safety car also readily adapts itself to the zone system of fares; in fact, it is the exponent of economy and efficiency in operation—the agent that will restore confidence in the electric railway industry.

Women Conductors for St. Louis

The United Railways, St. Louis, Mo., has its first women conductors in training, special quarters having been fitted up for them, along with a rear platform and trailer entrance and vestibule in the schoolroom. A majority of the twenty-odd students are wives or relatives of employees. The training course will cover sixteen days. It is made clear that their employment was distinctly a war measure. They will be called "conductors" and receive the same pay as the men.

Agreement Reached Between City and Montreal Tramways Company

After much delay and the formulation of many schemes, an agreement has been reached respecting the conditions upon which the franchise of the Montreal Tramways Company has been extended. The provincial government several months ago appointed a commission to enquire into the whole position. Their report has been issued, and a contract signed by the commission and the company, which, however, is subject to the sanction of the local legislature.

The contract extends the franchise 35 years, and sets up a permanent tramways commission, which is to have jurisdiction over all the company's lines or any of its subsidiaries, so far as finances, operation, extension, and disputes are concerned. The three members of the commision are to be named by the Lieutenant-Governor-in-Council, and will remain in office ten years, but can be removed for cause by the government. The city and the company have also the right to appeal to the Superior Court for the removal of a member for a number of causes, including fraud, corruption, and the refusal to fulfil in good faith the duties, etc. No member can be connected with the city or any municipal corporation interested, nor shareholders in the tramways company, nor have an interest in a contract with one of the parties or interested municipalities. Appeals from the decision of the commission can be made to the Public Utilities Commission. The commission is vested with very full powers as to examining the books, files, and property of the company, and must report yearly to the city on the condition of the capital account and other accounts referring to maintenance and renewals, reserve funds, and the lowering of tariffs. The rights, privileges, and franchises possessed already by the company in the city are annulled, and any that it possesses in other municipalities or will possess will be annulled by the mere fact of these territories being annexed to the city. In such cases the annexed territories would fall under the new contract.

Conditions of the Franchise

The company is forbidden to sell, cede, transport, or lend, in whole or in part, directly or indirectly, the system or any of the rights obtained by the contract. The company guarantees the city against all claims which could be pronounced by reason of the construction, existence, maintenance, repairs, or exploiting of the tramway system. The company also undertakes not to attempt, inside or beyond the city, any enterprise, industrial or commercial, other than those shown in the contract and relative to it. Except for the arrangement of the Tramway Company with the Montreal and Southern Counties Railway Company, the company is not permitted, without the consent of the commission, to allow cars of any other company to go over the lines.

Several new lines, totalling 13 miles, are to be constructed by November 1, 1918, but the commission can extend this time, and the schedules have also been rearranged. The commission has power to order the construction of further lines from time to time and also power to order the rearrangement of the lines, poles, cables, etc. Every pole in the city, when renewed, must be of iron, and iron poles must be used on the construction of new lines. The commission will determine the speed of cars, location of transfer points, frequency of service, and so on; also the number of passengers each car may contain, the company to indicate this number on the outside of the car in large figures.

The city can compel the company to flush, sprinkle, and sweep the streets in which it has tracks, and to haul garbage, etc., at a price not to exceed 10 per cent. profit on the cost, providing that the work does not interfere with the traffic. Any contract entailing an expenditure exceeding $50,000 must be submitted to the commission within a week for its approval or disapproval.

The commission has authority to modify fares. The latter will be made uniform for the city and certain outlying districts named, to be known as the "uniform rate territory"; outside of this the company may fix different rates for local traffic and for passengers going into the uniform rate territory. The commission may vary the rates for certain hours, and fix a tariff for children and apprentices. Transfer points are to be punched on the transfers.

May Transport Freight

The company has the right to transport freight, but this is not to impede passenger traffic. The company is expressly prohibited from interfering with the formation of union among its employees. The fine for failing to comply with the contract or to refuse to comply with any order of the commission is $40 per day.

The capital value of the company is placed at $36,286,295 (Dr. L. A. Herdt was one of the valuers of the plant and assets), and the company cannot pay more than 10 per cent. per annum on this fixed capital. Six per cent. on the latter is virtually guaranteed. The amount per revenue car-mile it can spend on operation expenses will be fixed by the commission, and the establishment of various funds is ordained as follows: A fund of $500,000, to be created by $100,000 instalments in five years to pay off old debts and excesses in the operation fund beyond the amount set each year by the commission; a maintenance and renewal fund; a tolls reduction fund; and a reserve contingency fund. An annual sum of $500,000 is to be given to the city, and when everything else is provided for, including dividends of the company, the surplus is to be divided as follows: 30 per cent. to the city, 20 per cent. to the company, and 50 per cent. for the reduction of fares. Whenever the latter fund reaches $2,000,000 it must be applied to the reduction of fares.

The city has the right to expropriate the property at the end of the term of the franchise by paying for the value of the property as fixed by arbitration, with an addition of 10 per cent.

Fare Checks and Lottery of Lima Street Railway

No cash registers are used on the street cars of Lima, Peru, the company preferring to rely for its records upon serially numbered, printed paper slips somewhat similar to the transfers used in the United States. One of these is given to each passenger when his fare is paid, and he is required to show it to the inspector who boards the cars at frequent intervals to check up the conductor. Two kinds of slips are used—one for a straight ride and another for a "connection," or transfer to another line. When the latter is presented to the conductor of the connecting line, one end is torn to show that it has been cancelled, but the ticket is retained by the passenger, as in the case of the straight-ride ticket, so that he may participate in the monthly or semi-monthly drawings of the company. Different colored tickets are used on each line, and these are changed from day to day to avoid fraudulent use of the tickets. The lines about the city are divided into four sections. A prize of £30 is given to each of the three principal sections and £10 is given to the fourth. From among the numbers appearing on the tickets sold, as verified by the company's books, one is drawn for each line and the prize is awarded to the holder of that ticket. In case the prize is not claimed within four days after the drawing, all tickets sold on the day of the drawing on the line issuing the ticket that was not presented, whose last three numbers are the same as the last three of the winning ticket, are entitled to a prize of £1 each. This scheme is thought to encourage riding on the cars. In 1916 the total number of passengers carried was 28,500,000.—Commerce Reports.

The Dealer and Contractor

Improved Electrical Conditions in Province of Quebec

A new bill providing for the licensing of electrical contractors in the Province of Quebec, noted in the last issue of the Electrical News, has made possible better provision for the protection of public buildings against fire, as shown by amendments introduced in another bill now before the house.

One of the sub-sections inserted states that "no electric installation in a public building in the province for the transmission of light, motive power, or heat shall be put in or altered except by a person or under the immediate supervision of a person duly authorized and holding a license to that effect."

Another clause reads: "Every heating apparatus already installed in a building, or to be so in future, must be approved by one of the inspectors of public buildings, who shall give the proprietor of the building a certificate to that effect. This certificate must be always posted up at the place indicated by the inspector."

Still another clause states that "the chief inspector of public buildings may, with the approval of the Minister of Public Works and Labor, declare any electric installation or heating apparatus now in any public building, defective, and may order the necessary alterations to be made, and, if the proprietor does not comply with the said inspector's orders to that effect, he shall be liable to the penalties provided for elsewhere."

National Association of Contractors and Dealers

The National Association of Electrical Contractors and Dealers became a reality on January 22, and at the same time the official life of the National Electrical Contractors' Association, of which it is the logical successor, came to an end. The new association has been formed along the lines recently outlined by W. L. Goodwin and generally referred to as the Goodwin plan of reorganization, which was outlined in the issues of December 1 and December 15 of the Electrical News. One of the most important changes is the provision for extending the membership of the association so that it includes all retailers of electrical goods, whether they be department stores, hardware stores, central stations, contractor-dealers, or dealers exclusively in electrical supplies. The effect of supplies being handled by these various organizations on a different scale of prices is well known, and the results which are possible from a getting together of the various elements in the trade should be beneficial.

Opening Montreal Office

The Railway and Power Engineering Corporation, Ltd., Toronto, have opened an office in Montreal in the Power Building. Mr. J. G. Bryson, formerly of the Northern Electric Company, has been appointed Eastern manager for this corporation

Building Up Export Business

It is always a pleasure to record in these columns instances of initiative and push on the part of Canadian manufacturers in reaching out for a share of the export field. In this instance reference is made to the Duncan Electrical Company, Ltd., of 1665 St. James Street, Montreal, who have, by the application of steady persistence, coupled with experience and expert knowledge of conditions in, and requirements of, different foreign countries, built up a satisfactory trade in most parts of the world in their manufactures.

One line, originally manufactured specially for the South American market, where they have sold very large quantities, has since been shipped largely to allied and neutral Continental Europe. To meet the demands from many parts of the world for a former German product the company are now making what are known as "Tower" bolts, which they now export in large quantities.

The company recognized that, to seriously interest a foreign buyer, one essential was to talk to him in his own language, and their lists and pamphlets are, therefore, printed in English, French, Spanish, and Portuguese, and in some instances where the article is particularly interesting to that country, in Russian also.

In the beginning some doubts were expressed as to the possibility of competing successfully with the large American factories, but increased production, improved methods, and a little extra "ginger" disposed of these doubts in short order by that best of proof, "results."

The export department was suggested, organized, and developed by Mr. H. N. Howlett, and remains under his control.—Industrial Canada.

Electric Sign that Uses Fewer Lamps

An electric sign construction has been perfected by a United States firm which uses circular disc-shaped reflectors mounted within the stroke of the letter in the same position in which receptacles would ordinarily be placed. These reflectors are detachably mounted, and are adjustable to any position which leaves the sign in the shape of a regular painted sign, with the exception that the characters are studded or outlined with the adjustable circular disc reflectors. In the case of the letter "S" the receptacles are mounted in the upper and lower loops of the letter, one receptacle within each loop, making two in all. Electric bulbs are mounted in these receptacles, each electric bulb having a small cap placed over the exposed end or tip to obscure the view of the lamp from the line of vision. The circular disc reflectors are then adjusted so that they are focused to the lamp in their respective vicinity. The light rays from each lamp are projected outward in a straight line at right angles to the plane of the sign by the reflectors. The result of this arrangement is a brilliantly illuminated sign, giving an effect equal to the ordinary or old style exposed bulb sign. Operation of the sign is, also, more economical, due to fewer lamps than in the exposed bulb type

Mr. Merz on Inventions Board

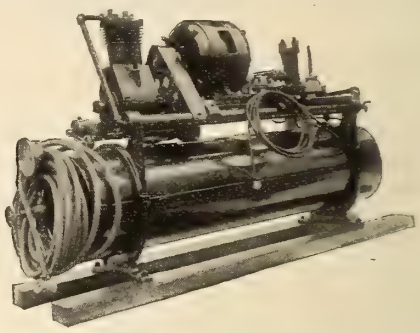
In the recent radical changes in the British Admiralty, by which a complete scheme for the organization of a naval general staff has been carried into effect, the government has obtained the services of Mr. Charles H. Merz, M.I.C.E., the well-known electrical consulting engineer. He has been appointed director of experiments and research (unpaid). This involves the reorganization of the Admiralty Board of Invention and Research, and has the object at once of securing greater concentration of effort in connection with scientific research and experiment and ensuring that the distinguished scientists who are giving their assistance to the Admiralty are more constantly in and amongst the problems upon which they are advising. Mr. Merz, who has been associated with the B.I.R. since its inception, will direct and supervise all the executive arrangements in connection with the organization of scientific research and experiments. Mr. Merz will also be a member of the Central Committee of the B.I.R., under the presidency of Admiral of the Fleet Lord Fisher.

Reducing Fire Hazards

Further particulars of the bill for licensing electrical contractors, introduced by the Hon. L. A. Taschereau into the Quebec Legislature, are now available. Mr. Taschereau bases the legislation on the need for greater protection from fire, the bill applying to public buildings and including churches, schools, hotels, boarding houses with accommodation for 15 boarders, office buildings, and others. It is provided that no electric installation in the province for the transmission of light, motive power, or heat shall be put in or altered except by a person or under the immediate supervision of a person duly authorized and holding a license to that effect. The Lieutenant-Governor-in-Council may prescribe the conditions on which the license shall be granted, the fee chargeable thereon, and the conditions of installation.

Automatic Controller for Heating Appliances

For use with electric heating appliances, such as electric pads, scalp treatment pads, blankets, a Seattle manufacturer is offering the trade an automatic temperature controller which, it is said, will maintain any given temperature from 90 degrees F. to 160 degrees F., with a variation of about one degree. The controller can also be used, the maker points out, to control the temperature of electric irons, toasters, percolators, chafing dishes, etc., rated up to and including 660 watts and maintain temperatures of 250 to 800 degrees F. For use with this controller, a special pad is made for sick room service, which is 12 inches wide by 24 inches long, and can be rolled up or folded, and can be used with wet packs. The temperature controller, when employed with this pad, makes it possible to hold the temperature of the pad when rolled or folded at a constant or variable temperature.

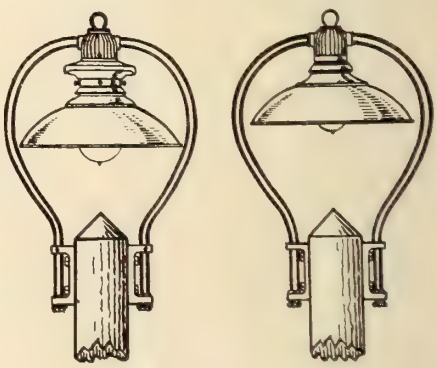


Attractive Kitchener Booklet

The Kitchener Manufacturers' Association have just published a very attractive booklet, for distribution, describing the manufacturing activities of their city. The illustrative work is wonderfully good and the booklet as a whole is a credit to the wide-awake organization that produced it. An advertisement of interest to electrical men is that of the Onward Manufacturing Company.

An electrical engineering office and storage battery station is being opened in Fredericton, N.B., by Mr. H. C. Moore, B.Sc. A line of electrical appliances and supplies will also be carried.

New Automatic Air Pressure Outfit

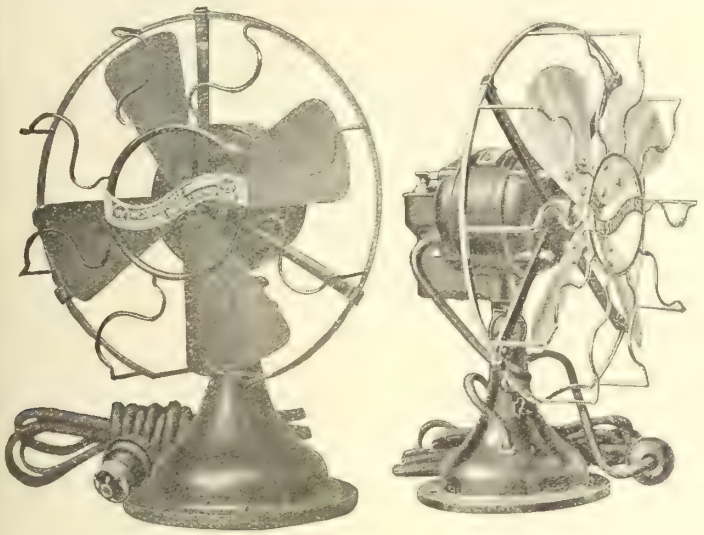


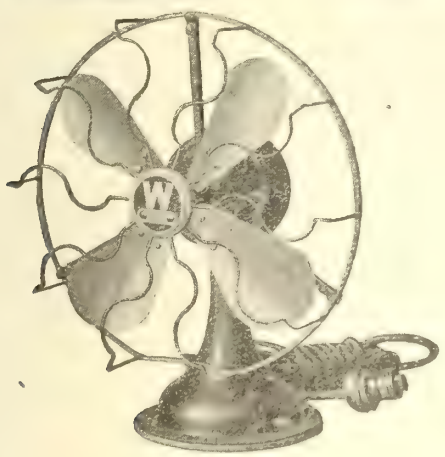
A new outfit has been developed by the M. L. Bastian Auto Engineering Works, Olney, Philadelphia, Pa., for service in garages and other places where air is required. The outfit contains a pump, motor, storage tank, pressure gauge and the necessary air and electrical connectors. The steel tank is 12 inches in diameter by 48 inches long, and is tested to a pressure of 300 pounds per square inch. The pump is a two-cylinder, air cooled design with a 1¾-inch bore and 3-inch stroke. The cast iron pistons are each equipped with eight perfection piston rings. The piston rods are bronze

with split bearings on the crank end for adjustment. The crank shaft is steel, one inch in diameter and micrometer gauged to size. Oiling is by the splash system and a sight gauge for determining the oil level is provided at the side of the pump. The outfit is equipped with a one-way valve between the tank and pump and when the pump is stopped the air is not held by check in the pump and the pump does not start against pressure. The pump is gear connected to a one-half horse-power Robbins & Myers motor, which is equipped with cord and plug for connection to a lamp socket. A rawhide pinion is provided on the motor shaft to eliminate unnecessary gear noise.

Lyre-Top Fixtures

Lyre-top fixtures designed for use in railroad yards and similar places have been designed by the Wheeler Reflector Company. The fixture on the right has a canopy with ports cast in the side, into which the arms are screwed for forming the frame of the bracket. This canopy has a copper screw





ring rolled inside, which engages the threaded collar on the reflector, making a rigid support. The lyre top shown on the left is used with a high-tension series porcelain receptacle head and the same reflector shown on the right.

The Maritime Telephone & Telegraph Company, operating in Halifax, reports that since the explosion there they have had to handle 582 order-outs. 408 of these were contained in a blanket order covering telephones that were in the heart of the devastated area; 174 were ordered out by subscribers.

Westinghouse Fans for 1918

Concentration on those models whose serviceability and popularity have been amply tested has been the aim of the 1918 changes in the line of fans made by the Westinghouse Electric and Manufacturing Company. The six-blade fans have been eliminated and some of the less popular ceiling fans have been withdrawn. All portable fans are provided with a hinge joint, to adapt them to mounting on either desk or wall. The oscillating mechanism can be adjusted for a "swing" of from 45 to 90 degrees at the rate of eight per minute, or can be locked out of service entirely. A tilt of 20 degrees from horizontal can also be had. The Whirlwind, an 8-inch fan, at a popular price, has the drawn steel construction. From it have been omitted, however, such refinements as speed control, highly polished blades, and others not necessary for durability. Current can be cut off by separating the attachment plug. The remainder of the portable line includes both oscillating and non-oscillating fans of 10, 12, and 16-

inch diameters. Ten-inch fans have zinc-plated, polished, and lacquered blades; 12 and 16-inch models have polished and lacquered brass blades. Finish of all other parts is dull black. All models are packed in substantial boxes, and include attachment plug and eight feet of cord.

Gyrating fans are furnished for either floor or ceiling mounting. The fans themselves are six-blade, 12-inch models, attached to a rotating body, which turns on a ball-bearing. One of the fan motors is geared to a mechanical drive operating on a central stationary pulley. Thus the rate of revolution does not vary with the air-reaction. Breeze at any angle from horizontal to 35 degrees below can be secured. Finish is dull black throughout, save for the blades, which are polished brass. No guards are furnished. Ceiling fans are furnished in four-blade models, of 32 and 56 inches diameter.

Industrial Lighting Reflectors

The efficient illumination of industrial plants has been made the subject of serious study for the last few years, not only from the point of view of initial economy, but having in mind also the increased value of the finished product, the lessened percentage of defective pieces, and the greater contentment of workmen relieved of nervous tension produced by eye-strain. The Wheeler Reflector Company has provided reflectors which not only show a maximum of illuminating value, but, in addition, offer designs specially adapted to the character of operation conducted under their light. Thus for general illumination of large areas group W reflectors (Fig. 1) are recommended. These can be used in lighting confined spaces also, but frequently a workman at a bench or loom or an individual machine may need a greater intensity of illumination than is essential in other parts of the plant. So a

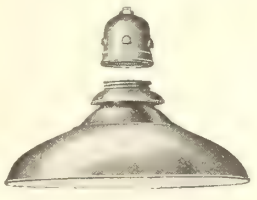


Fig. 1

Fig. 2

Fig. 3

Fig. 4

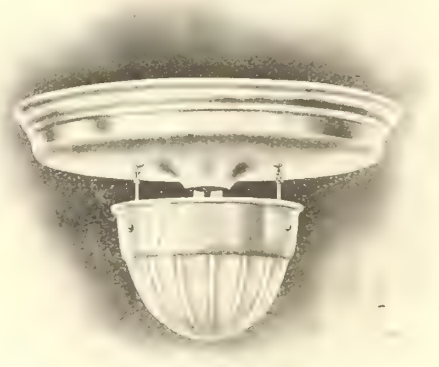

Fig 5

different type of reflector (Fig. 2) is suggested, with a smaller lamp, hung nearer the working plane, which has the effect of localizing the light. Again, the operation may be of such a character that light thrown from the side may be required to give the proper service, and group N (Fig. 3) reflectors can be used to better advantage.

Or a unit may be needed with an opaque glass globe to diffuse light from its larger surface (Fig. 4). Or offices, drafting rooms, and exhibition rooms may suggest a semi-indirect type of fixture (Fig. 5), which can be employed where the dirt and dust of a workroom is absent. A selection of the proper lighting unit, under advice from a competent engineer, may, therefore, be expected to ensure better service. The Canadian General Electric Company, Ltd., are acting as Canadian agents for the Wheeler Reflector Company.

Personals

Mr. George B. Frost, who for six years has been manager of the Smith's Falls Electric Power Company, Limited, Smith's Falls, Ont., was elected to the local hydro-electric commission at the municipal elections on January 7. At the first meeting of the commission, Mr. J. F. Montgomery, ex-mayor, was elected chairman and Mr. Frost, secretary.

Mr. J. S. Gould, who for twenty-five years was proprietor of the Citizens' Electric Company, Smith's Falls, Ont., since the purchase of that company by the Hydro has established an electrical contracting business, under the name of Alex. Baker & Company.

Mr. William Gore, of Toronto, who has been elected a member of the Canadian Society of Civil Engineers, was at one time with the Fowler Waring Cable Company, London, Eng., engaged on the design of telegraph, submarine and telephone cables and the machinery for their manufacture. He is now consulting engineer to the John verMehr Engineering Company, Toronto.

Mr. E. A. Seath, formerly with the Montreal office of the Canada Wire and Cable Company, Ltd., and the Moloney Electric Company of Canada, Ltd., has been appointed manager for the Maritime Provinces of these companies, and has opened an office at 674 Barrington Street, Halifax. He is succeeded in Montreal by Mr. Harry Riley, formerly of the Toronto office of the Canada Wire and Cable Company.

Electricity to Help Farm Production

The electrical engineering department of the Iowa State College recently planned an extensive exhibit of electric appliances and farm lighting sets for the farm and home short-course week at the college, which was held from January 28 to February 2. The farmer must help in speeding-up production. Electric lighting, electric motor-driven machines, and other electrical appliances will serve as important factors in this increased production. With these conveniences the farmer can do faster work with fewer mistakes. This is the belief of the electrical department, which concentrated every effort to make the exhibit a success.

Power Farm Machinery at O.A.C.

A short course at the Ontario Agricultural College, Guelph, concluded on February 2, and was designed to teach young men on farms how to operate power machinery and electrical equipment. About 150 enrolled in the class, under the guidance of Prof. W. H. Day and a number of experts from various machinery companies. Many farmers attended a demonstration on the closing day and learned what had been accomplished and also the benefits of electrical labor-saving devices.

Electrical Men on Engineering Institute Council

Electrical engineers are well represented among the new officers and council of The Engineering Institute of Canada, lately known as the Canadian Society of Civil Engineers. At the annual meeting, held last week, Mr. R. F. Hayward, chief engineer and general manager of the Western Canada Power Co., Vancouver, was elected vice-president, while Mr. J. M. Robertson, consulting engineer, Montreal, and Mr. John Murphy, electrical engineer, of the Department of Railways & Canals, Ottawa, were elected members of the Council.

Trade Publications

Condulets—Condulet Suggestion No. 5, by the Crouse-Hinds Company of Canada. This particular folder deals with dust-tight fittings specially designed for wiring in textile mills. These type Z G C condulets house the motor fuses and provide places and means for mounting the protected snap switches in convenient position.

Current News and Notes

Brandon, Man.

The Canada Gas and Electric Corporation, of Brandon, Man., which has been supplying power to the Brandon Municipal Railway at 2 cents per kw. h., raised the rate on February 1 to 5 cents per kw. h. As the railway was not, under the old rate, a paying utility, the increase, which will amount to $15,000 annually, will, it is hinted, necessitate a complete tie-up.

Calgary, Alta.

The Alberta Federation of Labor recently passed resolutions condemning the "one-man" street car. This should constitute a deciding factor in favor of this type of car, being an admission that they conserve labor and expenditure—an all-important factor in these present days. With the existing shortage of man-power surely the Federation of Labor need have no fear of unemployment.

Guelph, Ont.

A movement is on foot in Guelph, Ont., to develop the unused power on the Speed River. The Hydro-Electric Power Commission will make an investigation.

Kingston, Ont.

The Public Utilities Commission of Kingston, Ont., have granted a rate of 1 cent per kw. h. where current is used in heaters of 600 watts capacity or over.

Montreal, Que.

The annual statement of the Abitibi Power and Paper Company, submitted on February 11, showed that the company's earnings for the year 1917, before providing for depreciation, exhaustion of timber areas, interest, etc., were $1,323,001. After deducting fixed and other charges there remained a surplus of $341,123, which, added to the surplus of $360,925 in 1916, made a total of $702,047, out of which were paid dividends on preferred stock amounting to $70,000.

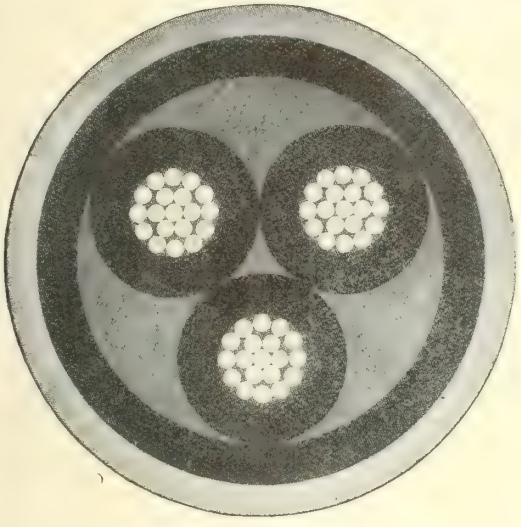
Smith's Falls, Ont.

Both the Citizens' Electric Company and the Smith's Falls Electric Power Company were taken over by the municipality on January 1, 1918, and are now operated by the Smith's Falls Hydro-Electric Commision.

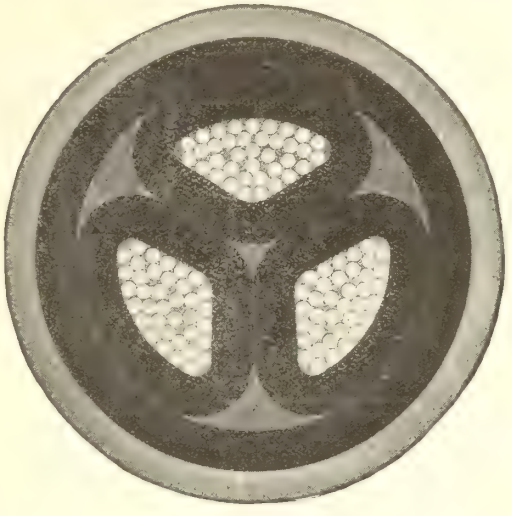
Toronto, Ont.

It is stated that plans and specifications have been ordered prepared for a modern car factory to be used by the city of Toronto when the street railway is taken over in 1921. It was also decided by the Transportation Commission to order 250 cars for delivery in September, 1921.

A Toronto electrical contractor, charged with undertaking new electrical installation in a residence without having secured a permit from the electrical inspection department of the Hydro-Electric Power Commision of Ontario, was recently fined $50 and costs, or thirty days in jail.



Winnipeg, Man.



The report of the Manitoba Government telephones for the year just ended shows a deficit of $30,349.96. The revenue for the year is stated to have been $1,847,704.52, while the operating expenses totalled $1,406,940.17, showing the net telephone earnings as $440,764.35. Against this were items of $45,450.40 for salaries to men of the department in military service and $425,663.91 interest charges.

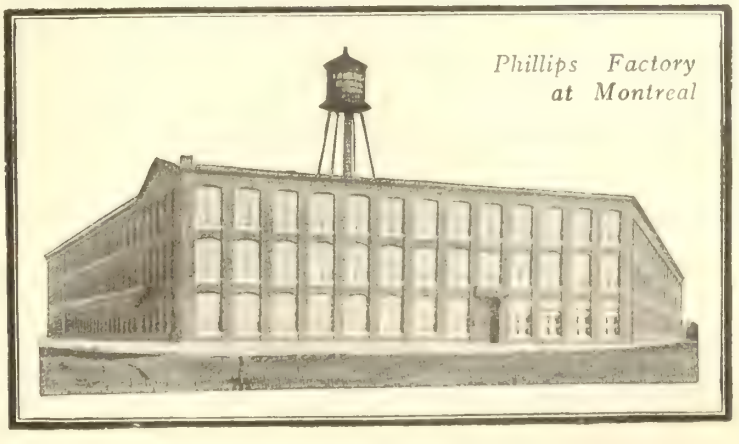
For the first time in its history the Winnipeg Street Railway Company has failed to meet its financial obligations to the city on the date fixed by charter. Five per cent. of earnings, amounting to $99,000, was due on February 1, but remains unpaid, as the company, according to its solicitor, is financially unable to meet the obligation.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:
"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

TRADE AUM MARK **Renewable Fuses**

FOR ELECTRIC LIGHT AND POWER

Always were the simplest fuses in construction on the market. The new Type "B," Form 4, has been reduced to the fewest parts—four metal parts of solid brass, a fibre shell and the fuse strip. Caps are removed by a twist of the wrist and as easily tightened, holding the fuse strip in intimate metal-to-metal contact.

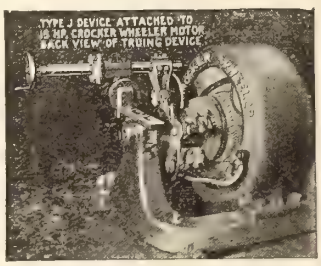
Tenders

A few dollars spent in advertising your proposals in

The Contract Record

would result in additional competition, which might save your city or town or your client many hundreds of dollars.



The Jordan Commutator Truing Device

Operates without removing armature. No shut down of motor or generator.

No large cuts from commutator and no unnecessary waste of copper.

No dragging of copper causing short circuits.

No portable slide-rest with the danger of the tool digging into the commutator and numerous other chances of damage to the commutator or armature which are all overcome with this machine.

JORDAN BROS., Inc., 74 Beekman St., New York

THIS TRADE MARK J O B IS YOUR GUARANTEE

Made in Canada

Water Turbines

Hydraulic Governors

High Efficiency Pumps

Vertical Turbines

shown in the accompanying illustration were designed and manufactured by us for the Hydro-Electric Power Commission of Ontario. They are among the largest water turbines installed in Canada and are characteristic of the high efficiency of our engineering department.

The services of these experts are at your disposal to consult on any of your engineering troubles.

BOVING HYDRAULIC & ENGINEERING CO., LIMITED

LINDSAY - ONTARIO

LOSING MEN

It is easy to lose track of a man in a plant of more than two departments. Just when you want him you cannot find him. Sometimes important matters are delayed while you are looking for the man that knows the details.

FINDING MEN

in a plant is also easy after you have installed a Presto-Call System. The Presto-Call is a Signal Service that we make in three sizes to call 5 men, 10 men or 20 men. It is easy to operate, and moderate in price; works with either vibrating or single stroke bells, or horns. The Presto-Call pays for itself in a few months.

Write for Booklet.

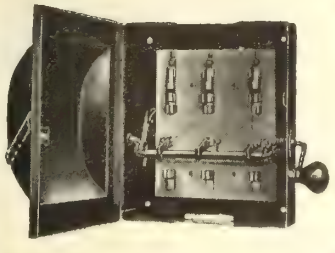
SQUARE D

STEEL ENCLOSED MOTOR STARTING SWITCHES

TO-DAY'S industry will influence the nature of our future peace. Maximum production is a vital necessity. Conditions demand the best in mechanical equipment. Machinery must be kept busy—shut-downs be avoided.



The Square D trade mark identifies the original Safety Switch, Square D Motor Starting Switches, because of superior mechanical design and substantial construction, not only make your machines safe-starting but also help you to avoid costly interruptions to service.

Don't trifle with imitations.

Greater Convenience in
R.C.O.C. SWITCHES

New designing has still further extended the scope of R-C-O-C Control. R-C-O-C switches now can be cut off by hand whenever expedient—and can be installed in pairs under a single cover to conserve space.

The New Combination Lever Attachment

facilitates closing switches by hand in daylight or night hours to locate burned out lamps or avoid outages while clearing series circuit trouble. Where White Way Systems are on only at certain times, the switches can be cut out of serivce.

Watchmen, patrolmen, time switches and irregular lamp hours are things of the past when R-C-O-C switches are installed. For the control of pole type or subway Constant Current Transformers, the R-C-O-C has proved the one satisfactory power house control in installations in every part of the United States and Canada. No matter how complicated your installation may be, R-C-O-C will control it from the power house. The R-C-O-C puts the whole service right under your thumb.

Write today for Bulletin—Engineering Counsel Free.

SOUTH BEND CURRENT CONTROL CO.
111 W. Colfax **SOUTH BEND, IND., U.S.A.**

The New 2-in-1 Case

is a notable convenience where manhole space is limited. It holds two switches and takes up little more room than a single switch case. More room to work in—less weight on pole line installation.

R-C-O-C Switches give the Central Station operator immediate and absolute control over all loads for all distances and for all purposes.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que.; Ottawa, Ont.; Quebec, Que.; St. John, N.B.; Toronto, Ont.; Vancouver, B.C.; Victoria, B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

OXY-ACETYLENE WELDING

A Maximum of Efficiency at a Minimum of Cost

Double Spirals of steel tubing assembled by Oxy-Acetylene Welding

The fact that products made by the Oxy-Acetylene Process are incontestably of greater strength and durability, and neater in appearance than those produced by other methods, is sufficient to prove its value to you. When it is realized that it also reduces the cost of production, it is then that you will appreciate the fact that

**Sooner or later you will profit by these advantages—
WHY NOT NOW?**

[illegible] a profitable investment. If you are not sure of this, ask us for further information; it will be gladly supplied.

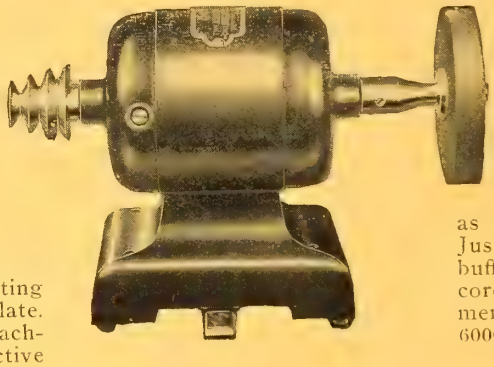
"DUMORE" UTILITY MOTORS



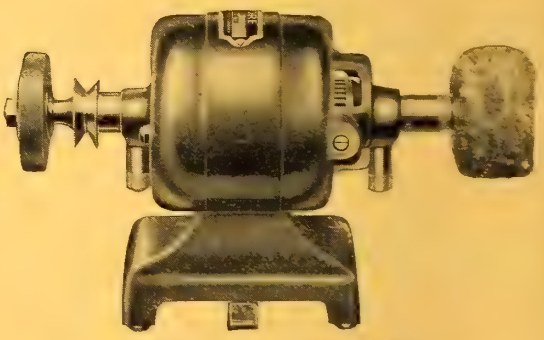
——are a boon to Housewives, and go a long way towards helping solve the servant problem by furnishing sufficient power to do light chores. "DUMORE" Utility Motors are small in size but capable of long, hard service in driving many domestic appliances, or with attachments for polishing silverware, cleaning cutlery, sharpening knives, etc., etc.

TYPE "A" 1 25 H.P.

Built to meet the demand for a light, compact power unit. Finished in black enamel. Equipped with 3 ft. of cord and attachment plug, wheel arbor and emery wheel. Wheel arbor nickel plated. Speed 2000 to 9000 R.P.M.

TYPE "B" 1 25 H.P.

The Type B Motor is the same as the Type A illustrated above, excepting that it is finished in all nickel plate. Equipped with 3 ft. of cord and attachment plug. Makes a very attractive looking motor for any use.



Type "C" 1 16 H.P.

Light and powerful. Always ready for use, and is as near trouble proof as it is possible to make a motor. Equipped regularly with 3-step pulley on one end of the motor shaft and a wheel arbor on the other, together with emery wheel. The Type "C" can be equipped the same as the Type "D" motor if so ordered. Just the motor for light polishing and buffing work. Equipped with 8 ft. of cord and attachment plug, Cutler-Hammer 3-speed Rheostat. Speeds 2000-6000-8000 R.P.M.

Practical—Efficient—Economical

For Jewelers, Dentists, Hotels and Restaurants the "DUMORE" Utility Motor will be found indispensable in a great many ways. Furnished in three sizes —"A"—1/25 H.P.; "C"—1/16 H.P., and "D"—1/8 H.P. For the benefit of the trade we have undertaken to advertise these famous "DUMORE" small motors to the public through the Daily Papers from coast to coast, and it will be to your distinct advantage to carry this line in stock for demonstration when called upon to do so.

For full particulars, prices and attractive literature, write our nearest house.

TYPE "D" 1 8 H.P.

The Type "D" Motor is one of the most popular of stock sizes. Is especially adapted for jewelers' and dentists' work. Equipped with 8 ft. cord and attachment plug. Cutler-Hammer 3-speed Rheostat in the base. Shaft ends are tapered. Ritter chucks and wheel arbors can be used on this motor. Speeds 2000-6000-8000 R.P.M.

Mr. Dealer—

Prepare for the House-Cleaning Season

EUREKA Electric Vacuum Cleaner

was awarded the Grand Prize by a Jury of Electrical Experts at the Panama Pacific International Exposition, San Francisco. EUREKA, the one best in competition with eighteen other makes.

EUREKA cleans mattresses perfectly.

THE EUREKA ELECTRIC VACUUM CLEANER excels in all requirements of high grade suction and great air displacement. Removes the maximum of dirt from the surface in the fabric, underneath carpets and rugs, without rubbing.

Cleaning portieres

THE EUREKA ELECTRIC VACUUM CLEANER possesses exclusive and convenient features, such as the "Eureka" Handle Lock, "Eureka" Button Switch and "Eureka" hose attachment, that are not to be found in any other similar make of Vacuum cleaner.

The nozzle, motor and blower frames are made in aluminum alloy of high grade finish. The compactness and lightness of the Eureka makes it most convenient to use.

THE EUREKA ELECTRIC VACUUM CLEANER comes complete with a handy set of attachments for cleaning portieres, upholstery, etc.

Handle Lock

New EUREKA Locking Handle —very durable and efficient, (patent applied for).

Convenient button switch and cord protecting knob, (patent applied for).

Cleaning under beds.

Write our nearest house for attractive literature and prices.

Showing "Protected" Rail Bonds being installed by the Union Traction Company of Indiana.

Doing the job right—with "Protected" Rail Bonds and Compressors

Done right—because with "Protected" Rail Bonds the soft copper strands and terminals make fitting easy and permit great compression to assure maximum conductivity.

Done right—because the "Shot-Over" Sleeves permanently protect the strands from the effects of vibration at the point where they emerge from the terminal.

Do it right in the first place—use "Protected" Rail Bonds and Compressors just as they are doing at Anderson, Ind.

Rebonding is expensive.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type 'S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

APPROVED SERVICE FITTING

Cat. No. FB712

Replaces Types B, BE, F, and FE.

TYPE "FB" ENTRANCE FITTINGS

These fittings have reversible hubs, permitting installation either as type "F" fittings on vertical pipe, or type "B" fittings on horizontal pipe.

The same parts are used for ½ in., ¾ in., and 1 in. fittings, excepting hubs, there being a separate hub for each size. The covers and porcelain are interchangeable from one size fitting to another, giving a very flexible stock arrangement.

Metal parts black japan or galvanized finish. Black japan furnished unless otherwise specified.

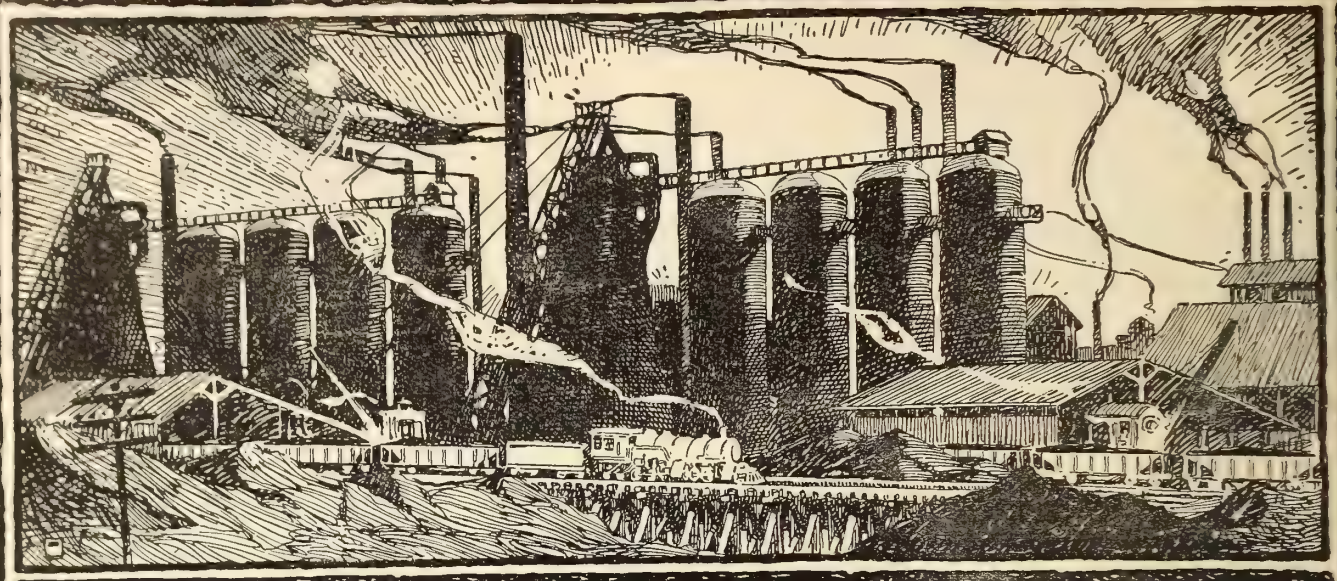
SUNDH SOLENOID MOTOR STARTERS

Compact and reliable starter for Direct Current. No sliding contacts.

The advantages of this type of construction are not only simplicity and easy replacement of wearing parts, but also the elimination of sliding contacts which cause trouble due to arcing and consequent sticking of the moving member.



The construction of the Sundh Automatic Starter is compact and simple, consisting of a solenoid, a plunger with retarding dash-pot, and two or more levers hinged to the lower pole-piece of the solenoid.

Send for illustrated Catalogue on Electrical Controlling Devices

The upper ends of the levers carry the contacts. The levers are controlled by their lower ends passing through a frame which is attached to the bottom of the plunger. The contacts are of copper and carbon, and all wearing parts are accessible and easily replaced. For heavy duty the final contact is made by a laminated copper brush. This copper brush, however, does not cut out any resistance, but merely short-circuits the carbon contacts which do cut out the resistance.

Sundh Electric Company — — New York, U.S.A.

LITTLE WORDS WITH BIG MEANING

Quality

According to "Webster," Quality is "an excellence of character; natural superiority."

Service

Webster's definition of "Service" is; "The performance of labor for the benefit of another."

We use these words advisedly—fully understanding their definitions—and realizing the obligation we place upon ourselves by their continued use in connection with our products of Iron and Steel, and our attitude to the people we serve.

Type I-14 Watthour Meter

The mere mention of the word "Swiss" in connection with watches recalls something delicate yet durable, accurate though minute. Those world-famed watchmakers have grown up with the trade; they are masters of their art. Each article that leaves their hands for sale, they know not where, is a living replica of their workmanship, is a vibrating proof of their skill.

A meter is in many ways a mechanism as perfect as a Swiss watch. The men who make C-G-E meters also are masters of their craft.

The jewel of the I-14 Meter is selected and minutely scrutinized for bad spots. The little sapphire must be perfect if it is to be used in C-G-E, Meters. In the manufacturing of the pivot bearing, the coils, and the registering apparatus, the same care is exercised. The result is the highly favorable light in which C-G-E Meters are viewed by the discriminating men of the Electrical profession.

Vol. 27 Toronto, March 1, 1918 No. 5

Power Situation in London Opportunity for Controller Drayton

An acute power situation is foreshadowed in London, Ont., by the announcement of the London Electric Company that they will shut down on April 1. This comes at an unfortunate time, when the Hydro Commission is urging the municipalities to greater economy, and when, therefore, it is a practical impossibility for the London Hydro to take on more customers without causing additional distress to the other Ontario municipalities. It is not to be wondered at that, with the increasing price of everything that contributes to the operation of a steam plant and the difficulty of getting coal at any price, the London Electric has found it impossible to compete with Niagara Falls power. In the present power shortage, however, the shut-down of this plant should be avoided in some way. Doubtless the Dominion power controller will find a ready solution of the difficulty, either by taking over the operation of the plant in the meantime or by instructing the company to continue operations under a guarantee that deficits will be reimbursed. As soon as the summer opens up the Hydro power situation should automatically adjust itself; in that case the London Hydro system could absorb, during four or five months, the entire business that must inevitably fall to them. Dismantling the plant, however, is courting trouble again next winter, and at the moment it looks as if the wisest course would be to continue the steam plant in operation until power shortage on the Hydro lines, winter or summer, is amply provided for.

Canada Leads the World In Fire Loss Per Capita

"Fire Prevention" was the subject of a talk by Chief Tremblay of the Montreal Fire Brigade, at the Montreal Electrical luncheon on February 20. He pointed out that, while practically no progress had been made in preventing fires, the development of electricity had had the effect of reducing fire losses and electrical men had done more in this direction than any others. This was not done with the set purpose of reducing losses, but the progress in their industry had had that result. Many fires were attributed to electrical causes, but whether the allegations were true he was not in a position to say. He declared that many of the fires could be avoided. In Europe, before the war, the loss was 25c per head; in Canada, $3.29; and in the United States, $2.88. Even making allowances for climatic and other conditions, the loss was far too large. Last year the fire loss in Canada was $24,000,000, a very high rate. Insurance companies were partly to blame for this, as they accepted bad risks, secured through agents who did not look beyond securing their commissions. This observation did not apply to all agents, but only to a section of them. Mr. Tremblay advocated the penalizing of insurers where fires were caused by neglecting civic by-laws; he would fine the parties for calling out the brigade, and also prohibit the payment of the insurance money. While we were taking measures to prevent waste no one had given a thought to the waste caused by fires and how to prevent them.

He had commenced a campaign to educate people along the lines of fire prevention, and in the business section of Montreal the results were very satisfactory. This education should be taken up by the federal and provincial governments, municipalities, schools, and factories. It would result in the saving of life and the reduction of premiums. The speaker also advocated the formation of an association in Montreal to take means to prevent fires.

Referring again to the electrical side of the subject, the chief remarked that quite a number of fires were due to electrical causes, and in this connection recalled a recent fire in Montreal in which five lives were lost, due to work being done by a man who had no experience in this line and was told to do the work with old scrap. A considerable amount of work of this kind was done by men who had no practical knowledge, and if this class of work was refused insurance by the companies, the people who were responsible for getting the work done would be compelled to spend money in getting repairs, etc., properly executed. Mr. Tremblay further expressed approval of the act just passed by the Quebec Legislature by which lighting, power and heating systems can be installed only by persons holding licenses.

Mr. W. H. Winter, the chairman, promised the co-operation of members of the luncheon in forming a committee to educate the public on the question of fire prevention.

Half-Cent Rate for Ontario Should Make Electric Cooking Universal

A joint meeting of the Ontario Municipal Electric Association and the Hydro-Electric Radial Association was held in Toronto on February 12. A number of resolutions were carried, including the recommendation that Mr. J. W. Lyon, chairman of the Hydro-Radial Association, be appointed to one of the vacancies in the Senate, so that the interests he represents may be given fair consideration.

Another resolution favored the taking over by the Dominion Government of the Grand Trunk and Grand Trunk Pacific. The C.P.R. was not included. In passing this latter resolution the hydro representatives apparently had in mind the electrification of many of the branches operating in Canada, which, as Sir Adam Beck stated, would remove the neces-

city to embark upon such an extensive scheme of radial lines as had been contemplated.

Sir Adam Beck also took occasion to announce the inauguration of a new domestic rate, designed to encourage cooking and, to some extent, heating. The present scheme calls for the payment of a certain rate, say, 2 cents per kw. h. up to a certain consumption per month, say, 30 kw. h.. and half that rate (in this case 1 cent per kw. h.) for all excess. It is now proposed to make the secondary rate (1 cent in above case) applicable to only an additional consumption of a fixed amount (say, 30 kw. h., as above), and the charge for all in excess (i.e. above 60 kw. h. in the case in question) at half the secondary rate, i.e., at ½ cent per kw. h. It was stated that this rate is already being tried out in Ottawa, and that other municipalities will be allowed to use it as soon as they show sufficient financial strength.

Prison Reform and Capital Punishment

Mr. Robert Bickerdike, president of the National Prison Reform Association, addressed the Montreal electrical luncheon on February 13 on "Prison Reform and Capital Punishment," a subject on which, remarked Mr. Drew, the chairman, in introducing Mr. Bickerdike, members of the electrical luncheon had no inside information. The speaker referred with satisfaction to the progress made by the prison reform movement, particularly in Ontario, where the result had been gratifying. He pointed to the large number of men now at work on the land, practically without restriction, and said that there were probably only 10 per cent. of the total number of prisoners at Guelph who could not be trusted without guards. In the Provinces of Ontario and Quebec a start had also been made in this reform work.

Touching on capital punishment, Mr. Bickerdike outlined many of the well-known arguments in favor of the abolition of hanging. He remarked that in this country we punished for the sake of revenge, which was contrary to the spirit of Christianity. The object of punishment was to reform the prisoners and not to take revenge. He was opposed to capital punishment because it was a relic of barbarism. He stated that he had received letters from the governors of thirteen states in America to the effect that since the abolition of capital punishment crimes had not increased and that in some states it had decreased.

Training Men for Industry

The old methods, such as leading a man to a lathe, giving him some material, and telling him to follow his blue prints, and, if he makes good, patting him on the back, but if he does not make good, firing him, and that of trying to tell a man everything there is to be known about a lathe and material, are now things of the past in the more up-to-date establishments, according to Mr. C. R. Dooley, manager of the education department of the Westinghouse Electric and Manufacturing Company. of Pittsburg, Pa. In Mr. Dooley's talk before the Toronto section of the American Institute of Electrical Engineers on February 15 he outlined the admirable work that is being done by the Westinghouse Electric and Manufacturing Company in East Pittsburg in training the trades apprentices and engineering apprentices in the manufacturing side of electrical engineering. Any educational method should have as its goal leadership, workmanship, and spirit. The speaker claimed that in training men for leadership they could obtain workmanship and spirit as by-products.

In supplying technical assistants to the various executives of the Westinghouse Company, Mr. Dooley found that these executives required their subordinates to have, first, the human characteristics, such as good judgment, initiative, analytical ability, courage, etc., and, as a less important part, technical knowledge of the fundamentals of their profession. The choosing of men was outlined, various methods being employed, among which are Blackburn's phrenology, mechanical tests of Munsterberg, and tests of Warfield Scott of the Northwestern University and Thorndike of Columbia. After the men are selected, the method of training is to place the men in the shops and to carry on their training by presenting to them in a systematic way a series of questions that apply to their daily work. These men can obtain the answers to their questions by asking their foremen, studying the literature of the company, or by any other means they wish. Mr. Dooley emphasized the value of personal discovery, and he said that the best type of teacher was the trained fellow-employee. The situation more or less summed up would be that people are slightly interested in things they are told, but vitally interested in things they take part in.

After the paper a most interesting and heated discussion was entered into, some of those taking part being Professors Baker and Henderson of Queen's University and Professor Price of Toronto University. Those who heard Mr. Dooley will long remember his most excellent presentation of a subject that in the past has been sadly neglected by engineers and employers in general, but one that is coming more and more to be realized as one of the fundamental activities that any live organization should carry on.

March Program Toronto Section A.I.E.E.

Friday, March 1—Engineers' Club, 8 p.m., a paper by Mr. R. P. Jackson, of the research division, Westinghouse Electric and Manufacturing Company, Pittsburg, on the subject. "Commercial and Industrial Research."

Friday, March 8, is the date of the institute meeting at Cleveland, in which the Toronto section is participating as a host. An interesting program of papers relating to underground distribution and the use of electric drive in steel mills has been arranged; also a joint meting with the Association of Iron and Steel Electrical Engineers and an informal dinner.

Friday March 15, Engineers' Club, 8 p.m., Mr. J. J. Frank will come up from the General Electric Company, Pittsfield, Mass., to give a paper on "Recent Developments in Transformer Practice."

More Storage Dams for Quebec

The Quebec Government, in pursuance of its policy of developing the water-powers of the province, has passed several bills authorizing the Quebec Streams Commission to construct further storage dams, this authority, however, being subject to the consent of the Lieutenant-Governor-in-Council. Thus dams may be built on Lake Kenogami, a branch of Lake St. Jean; on the Chicoutimi and Sable Rivers; the St. Anne and Sauvanne Rivers; the Jacques Cartier River, and elsewhere. The expenditure authorized is $4,000,000, but it does not follow that these works will be carried out immediately. The commision has made studies and plans of the possibilities of water storage on numerous rivers. Under another bill power is given to purchase railways, camps, a power plant, shops, machinery, etc., constructed by the St. Maurice Construction Company, in carrying out the contract for the building of La Loutre dam, on the St. Maurice River. The price is not to exceed $500,000. The purchase is subject to the Shawinigan Water and Power Company, Brown Corporation, and Laurentide Company, Ltd., agreeing to reimburse the commission $1,000,000 over the price payable under a previous contract for supplying water by the damming of the St. Maurice. The payment of the $1,000,000 is to be spread over 40 years. The St. Maurice Construction Company also agrees to renounce all claims for extra work incurred in the con-

struction of La Loutre dam, a sum of $298,807 being mentioned particularly in the bill. The amount of $1,500,000 for the La Loutre work, previously authorized, is to be raised to $2,500,000.

The Electric Club of Toronto

The last two February meetings of the Electric Club of Toronto were of unusual interest. On Friday, the 15th, the club was addressed by Col. Gordon Morrison, formerly of the 19th, but latterly in command of the 18th Overseas Battalion in France. Col. Morrison described his experiences from the time he left Toronto until his return on leave, interjecting some fine bits of humor, all going to show that efficient and thorough as the training of our officers may be beforehand, the "Tommy" still has it on him in many points as the firing line is approached.

The guest of the club on the 22nd was Mr. Arthur V. White, consulting engineer to the Commission of Conservation. Mr. White described the negotiations that have taken place from time to time during past years between the United States and Canadian Governments regarding international water-powers, and briefly outlined the treaties and the administrative bodies appointed to adjudicate the matters at issue. In closing, he touched upon the present fuel situation and the possibility of water-power in the form of electricity taking its place. Mr. White's remarks will be reviewed at some length in a later issue.

The speaker for March 1 is Professor G. M. Wrong, of Toronto University, and for March 8, Professor J. C. Fields. The chairman for the month of March is Mr. Frank Kennedy.

Second Acetic Acid Plant for Shawinigan

Announcement has been made by Mr. J. E. Aldred, president of the Shawinigan Water and Power Company, that the company would shortly erect and operate a plant for the manufacture of acetic acid for the United States Government, the whole enterprise to be financed by that government. The plant will be practically a duplicate of the one at present owned and operated by the Shawinigan company through its subsidiary, the Canadian Electro Products Company. The capital expenditure on the Canadian Electro Products plant is given as in the neighborhood of $2,000,000, and the new construction will involve approximately as much. The financial statement of the Shawinigan Water and Power Company, just submitted, shows gross earnings of $2,902,210, an expansion of $576,338, or 25 per cent., while net revenue, after charges and depreciation reserve, amounted to $1,350,864, an increase of $97,128, or slightly less than 8 per cent. The lower ratio of gain in net as compared with gross is explained chiefly in a rise of over $200,000 in expenditure, under the head of "power purchased," and upwards of $150,000 in interest charges. The former increase refers to an increased amount of power taken from Laurentide, a purchase which went to swell gross revenues, and the latter increase is due to enlargement of subsidiary plants the full benefit of which has not been reflected in the company's revenues.

Heat Efficiency of Containing Vessels

Some interesting data on the efficiency of various types of containing vessels when heated over electrical elements is contained in an article by R. G. Kloeffler in a recent issue of the Electrical World. Experiments were made with both open and enclosed units and kettles of both granite and aluminium of various sizes were used. The readings were taken on the amount of heat required to raise the temperature from that of ordinary tap water to 206 degrees F., the consumption being recorded on a standardized watt-hour meter.

The following utensils were used: A small bluish-gray granite kettle, diameter 6 inches; a small aluminium kettle, 6 inches diameter, perfectly flat bottom, called "new" in this article because it had a bright, new surface; a small aluminium kettle, same as above, except that it was discolored and dented on the bottom (called "old"); an aluminium fireless cooker pan, with perfectly flat 8-inch bottom; an agate granite pan and a white granite pan, each 8 inches diameter. All the utensils were fitted with covers.

The efficiency of the equipment is shown in Tables 1, 2,

and 3. Table 1 gives the figures for open and enclosed units with granite and new aluminium utensils. From the average percentages it may be noted that the open type has approximately 5 per cent. greater efficiency when used with granite than with aluminium. With the enclosed type of heating unit, however, the reverse is the case. The average showing of the new aluminium vessel is 8 per cent. higher in absolute efficiency than the granite. In terms of relative efficiency these figures become 12.7 per cent. and 20.7 per cent. in the two cases. In explanation of these findings the author offers the following:

"The open-type units give up their heat principally by radiation, though some convection and conduction will take place. On the one hand, the granite dishes will readily absorb the radiated heat, while the aluminium, if bright, will have a tendency to reflect the heat downward again. On the other hand, the enclosed unit gives out most of its heat by conduction, with smaller amounts emitted by radiation and convection. Here the granite dish, because the coating of enamel is a poor conductor of heat, does not receive the heat readily, while the aluminium dish, since aluminium is an excellent conductor of heat, acts more efficiently."

Tables 2 and 3 give the results of further tests. These show that the new aluminium utensil is approximately 8 per cent. more efficient than the old one with open units, and about 48 per cent. more efficient with closed units. These tables also give figures using utensils with and without lids. Columns 5 and 6 are computed efficiencies when, after being heated for 30 minutes, the utensils remained on the unit until the boiling of the wated ceased.

The figures in Table 3 indicate that the color of the enamel affects the amount of heat absorbed, though the difference is small. The second section in this table compares the efficiency with the time required for a given rise in temperature, using two different heating units of 1,100 and 1,500 watts respectively. The results show that the extra time is gained at an increase in total cost. The last section of Table 3 indicates that the units show a decrease in efficiency after being in service for a time.

Electrical Hazards in Bathrooms

Editor Electrical News:

I have read with much interest your timely article on the above, and agree with you that accidents such as the one alluded to should not be lightly passed over.

In our practice in Winnipeg we have largely prevented the use of portable devices in bathrooms by insisting for some years upon lamp sockets or receptacles being placed out of reach; but, where radiators are required, we either see that the receptacle is placed well away from the plumbing fixtures or call for the grounding of the radiator frame.

A close study of this problem will, I think, lead to the conclusion that ultimately we may find it advisable to follow the British practice and call for the grounding of the frames of portable devices. Such a rule has applied for work coming within the scope of the British Factory and Workshops Acts since 1908. This protection is also recommended by the United States Bureau of Standards in their "National Safety Code," November, 1916, in which it is stated that "the permanent grounding of frames of portable devices, etc., when the devices are used within eight feet of the floor in locations such as bathrooms, laundries, etc., where persons may easily touch grounded surfaces at the same time as the device, is recommended as a safety measure. Such grounding may be obtained by the use of a three-wire portable cord with the portable device, one wire being used for the ground conductor and the connections being properly designed so that wrong connections cannot be made by the user."

It might be profitable to have a discussion of these problems and any safeguards proposed, and I would be delighted if some of your readers would let us have their views, especially as to whether the new rule of the National Code (1918 edition) calling for the continuous identification of the neutral wire would afford a solution of the difficulty by using the same as a "ground." Of course, certain obvious fundamentals would be necessary in such a case—for instance, no grounding of secondaries by means of driven rods would, I venture to say, be considered an adequate form of grounding in such a case.

Yours truly,

(Signed) F. A. Cambridge,
City Electrician,

Winnipeg, Man.

A Travelling Anti-Waste Exhibit

In a large manufacturing plant where thousands are employed it is surprising to learn of the food products and manufacturing material wasted each day. To give the employees of the Westinghouse Electric and Manufacturing Company some idea of the waste the management devised the novel scheme of fitting up a storage battery truck as a travelling exhibit, upon it a collection of foods wasted, including bread, butter, meat, cakes, crackers, pickles, cheese, fruits, etc., as well as a quantity of manufacturing materials, such as copper, zinc, lead, mica, rubber, felt, gum, and similar materials, much of which could be used to advantage. It is estimated that the foodstuffs wasted per day amounts to between $35 and $50, the cost of which, of course, comes out of the employees' pockets, the waste of material amounting to hundreds of dollars per day, which would be a loss to the company if it were not that a force of men are continually assorting the seemingly scrap material and turning it back for use or so that the highest price may be obtained for scrap produce, all due largely to the thoughtlessness and carelessness of the employees. Above the material was constructed a sign reading, in large letters, "Wasted," and underneath the words, "Food brought from your homes," and on the other side, "Materials belonging to the company." This truck was driven up and down the shop aisles so that the employees could look upon it and form in their minds some idea of the waste. Such an object lesson is valuable at this time, when everyone should take all precautions necessary to effect as little waste as possible.

Striking exhibits of waste products.

Transmission Line Practice—Poles and Towers—Article III.

By Lieut. E. T. Driver and E. V. Pannell

The properties of conductors have occupied the first two articles in this series; it is next necessary to consider the line supports. First and foremost among these is the wood pole. It has been pointed out by Mr. R. D. Coombs* that the wood pole is very nearly ideal as a line support because the stresses it has to carry are almost identical with those which Nature designed the tree to withstand. The difference is, however, that the tree is permeated with living sap, whereas the pole is not, hence the elasticity of the latter will probably be lower and unless its cells are impregnated it will be subject to decay. Since the primitive days of power transmission, when poles were felled and trimmed right along the site of the line, the selection of poles has been more carefully studied, with the result that certain materials, e.g., white cedar, red cedar, and chestnut, have been found, from their natural impregnation, to be most resistant to decay, and have practically become standardized wherever they are readily obtainable. In view of the extended use of wood poles in Europe for telegraph and power lines, the practice of impregnating the whole pole as followed in the old world is of interest. The specification of the British Board of Trade states: "Poles shall be sound winter-felled red fir, free from long knots or other defects, and with the natural butt, and shall be well injected with creosote." The standard quality of creosote or wood tar injected amounts to 10 lbs. per cubic foot of pole. In addition, the butt and gains are frequently painted with a coating of hot Stockholm tar. Poles treated in this manner have been found to yield a life of thirty years or more.

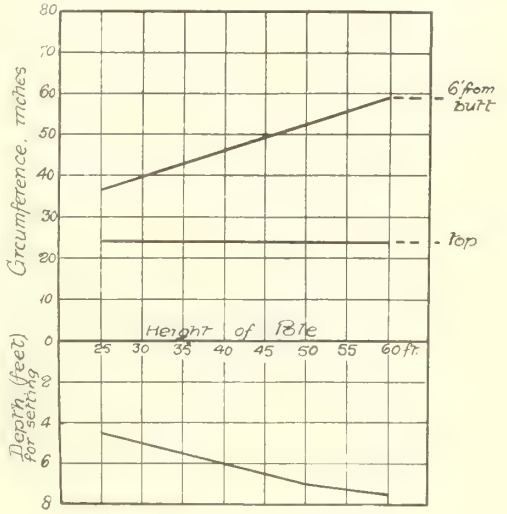
In America it is now universal practice to treat the butts and crossarm gains with carbolineum, and in view of the increased demand for reliability and the growing cost of renewals, it is probable that all poles will sooner or later be completely impregnated in a tank, as is done in England. Not the least advantage of a thorough treating process is that it places a cheap pole lumber, such as pine or Douglas fir, almost on a par with cedar, in respect of durability.

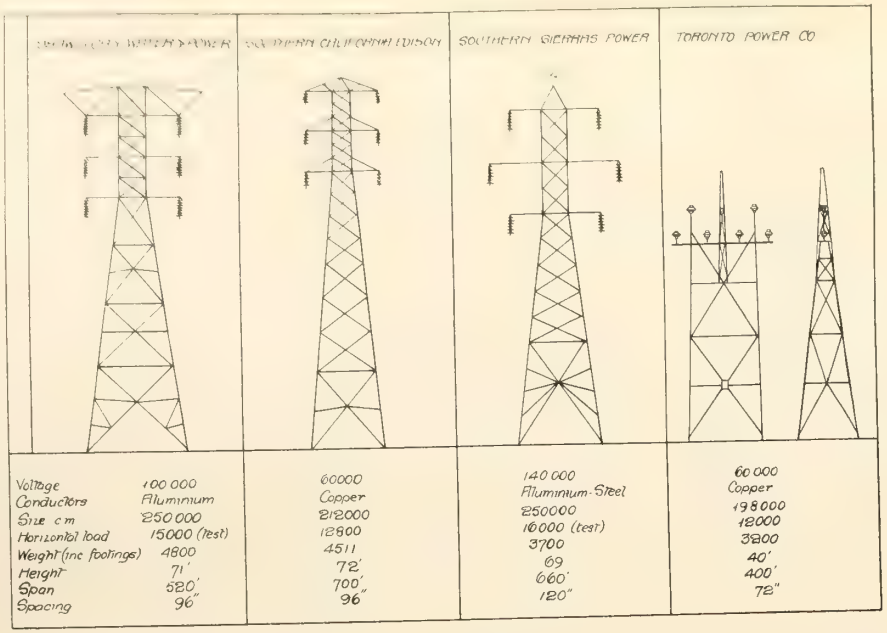
Wood poles offer much less diversity than specially designed steel transmission structures, as they are purchased in a limited number of stock sizes, against specifications covering size, straightness and general freedom from defects. Most of the cedar poles in use for modern transmission lines fall within the Classification A of the National Electric Light Association, (see Fig. 8). Such poles as are covered by this specification will readily sustain the stresses arising from a three-phase circuit of No. 4/0 copper on spans of 200 feet. Heavier conductors will be taken care of by the use of the same pole on a shorter span length. With the high transmission pressures now in use a double circuit cannot be satisfactorily mounted on a single pole; even with a single circuit the limit of a pole is reached at around 50,000 volts, beyond which the crossarms become too long. This problem is met by bracing two poles together in the form of an H with one horizontal crossarm across the top. This type of construction is being used by the Appalachian Power Company (80,000 volts), Central Colorado Power Company (100,000 volts), and the Montana Power Company (100,000 volts). This construction provides a reserve of stability so that the span length can be reasonably increased. For corner and dead end stresses the construction is still further modified by the use of a four-pole structure mounted on a square base and guyed.

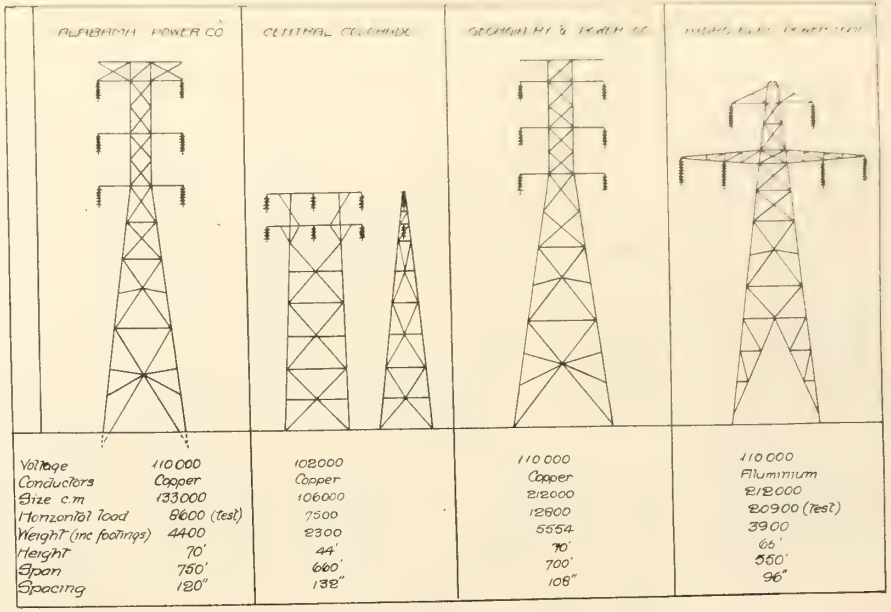
*("Pole and Tower Lines," McGraw, New York).

However, notwithstanding the simplicity and economy of wood pole lines, steel towers are now standard practice for modern high tension lines. A span of eight hundred feet can easily be handled by one steel tower carrying two circuits, whereas H poles mounted every two hundred feet would be necessary to carry one of these circuits only. The total number of poles replaced by one tower would, therefore, be sixteen. Further, the tower line would require six insulators per eight hundred feet, whilst the pole line would necessitate twenty-four. The difficulty of obtaining reasonably good deliveries on steel shapes has recently been the reason for the installation of several important transmission lines with wood poles, but this condition is only a temporary one.

The first steel tower line to be erected for power transmission was that of the Guanajuato Power Company, in Mexico, in 1903, and the number of towers erected in the succeeding fifteen years is estimated at half a million. During this period the design of the transmission structure has







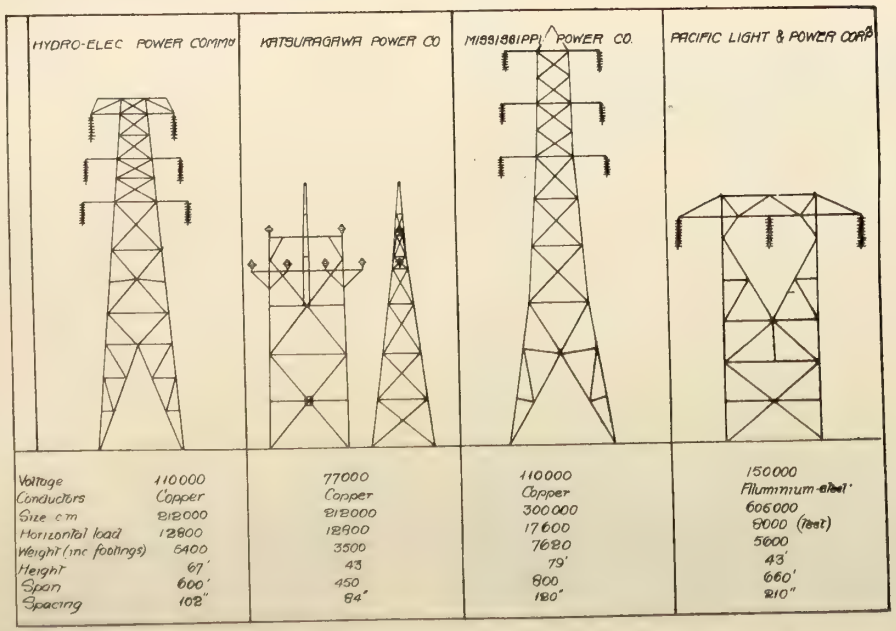


Fig. 8—Proportions of Cedar Poles (Class A, N.E.L.A. Specification)

been carefully studied, until its stresses and their distribution are fairly well understood. The principal loads sustained by any transmission line support are of two kilns, (a) transverse, and (b) longitudinal. The first is the total horizontal load due to the summated wind pressure on all the ice-covered wires of a span plus the wind pressure on the structure itself. As already shown, the wind load on the wires is commonly accepted at eight pounds per square foot of the projected area; this including a correction factor for cylindrical surfaces of sixty per cent. On the tower members themselves the surface being flat the wind pressure will be $8/.6 = 13$ lbs. per square foot, and will be figured upon twice the area of one side. Except in the case of a dead end or corner tower the longitudinal load (b) is very small, with a well constructed line, but it is necessary to allow for abnormal conditions. Along the line normally the pull on the tower from one side is exactly balanced by an identical pull on the other side. Should two cables swing together and burn off there will be an unbalanced pull on the tower crossarm amounting to the tension in these two conductors just before parting. However, several features come in to reduce this unbalanced pull, and it will be found that it

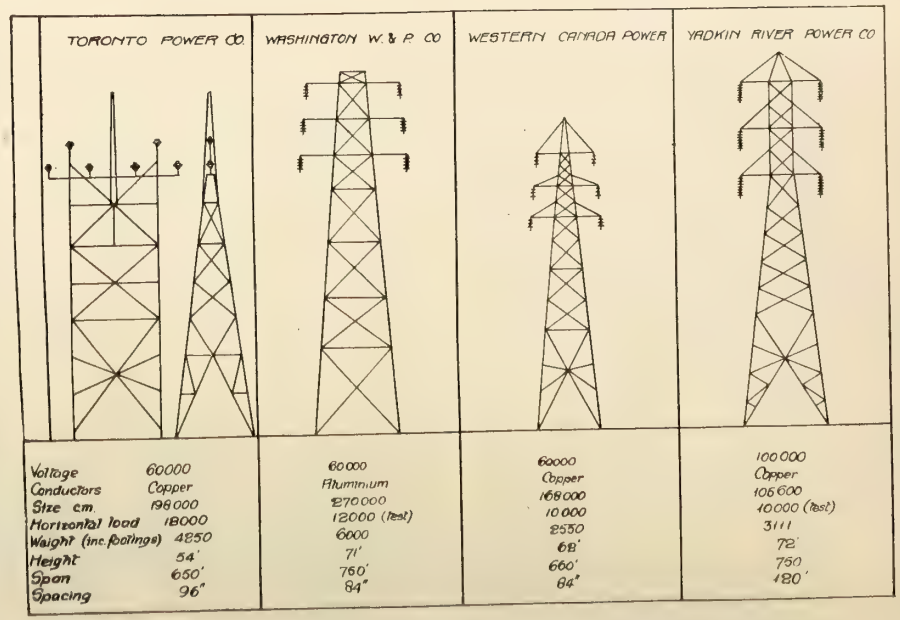

Fig. 9—Some idea of the diversity of tower designs may be obtained from these diagrams and the descriptive information accompanying each.

can never be quite as great as calculated on the above basis, and in most instances is probably very much less. As each wire breaks the suspension insulator swings up into line with the next span. This very short additional length considerably relieves the stress. Even in the case of pin type insulators where there is no such flexible element, it will be found that the cable slips through the tie wire before the tower can yield. Furthermore, from the properties of a suspended wire it is obvious that every fraction of an inch

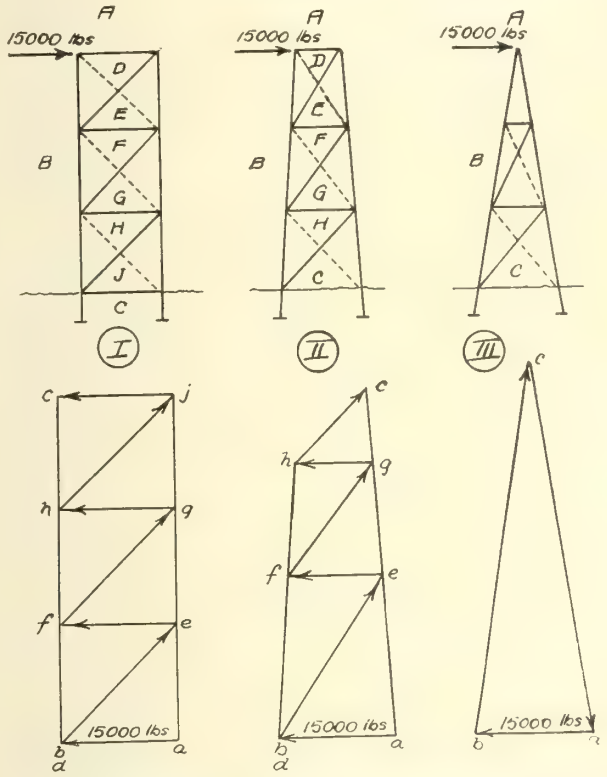

Fig. 10—Structure and stress diagrams for three elementary types of transmission line towers under concentrated test load of 15,000 pounds horizontal. The dotted ties carry no stress with the load on the side as shown. No allowance for weight.

which is added to the length of the catenary will cause a considerable reduction in the tension. Now every transmission tower will yield a few inches without failing, and so automatically relieve the horizontal load.

However, it is considered good practice to assume working conditions a little more severe than they actually are, and the average test requires of a suspension tower that it shall not fail until a pull amounting to the tension in half of the conductors on one side is applied. Except in the case of very small conductors, this stress is considerably greater than the transverse wind load, and forms the basis of the design for the towers. It is obviously unsatisfactory to design a tower with light bracing in one direction and heavier members on the other sides, just because one set of loads is less than the other; the whole structure is figured on the basis of the greater load. Consider a double circuit line of No. 4/0 copper with two 3/8 in. ground wires of galvanized steel strung upon a span of 600 feet. The lateral wind pressure per foot on this size of wire with ½ inch ice will be 1.01 lbs. and the total span will amount to:

$$6 \times 1.01 \times 600 = 3640 \text{ lbs.}$$

The load per foot on the 3/8 in. ground wire is .91 lbs. and the total

$$2 \times .91 \times 600 = 1090 \text{ lbs.}$$

$$\text{Total Load (a)} = 4730 \text{ lbs.}$$

Now consider the pull generated by the failure of three cables at the maximum stress. This stress amounts to 30,000 lbs. per square inch with copper and as a No. 4/0 cable has an area of .166 square inches the tension amounts to 5,000 lbs. per cable. When three cables fail the total load is

$$\text{(b)} = 15{,}000 \text{ lbs.}$$

or three times the maximum transverse load.

It is common practice to specify a test load applied diagonally being the resultant of loads (a) and (b). However, load (b) if figured upon three conductors failing would seem to provide ample margin of safety.

These foregoing observations apply to suspension towers. Where a corner has to be turned in the line or the cables have to be dead-ended, the structure must have considerably more stability, and it is usual to test such a tower with a horizontal load equal to the failure of all the cables on one side, or, in other words, with double the load of a standard structure. Such towers will be spaced from one every tenth to every sixth span, and still more frequently in uncertain ground, or where the alignment changes. From 70 to 90 per cent. of the line towers will, however, be of the standard type. The function of the tower is to transmit the horizontal load (which usually is assumed to centre on the middle crossarm) down to the footings. Fig. 10 shows diagrammatically how a single concentrated load (such as a test loading) is distributed in the fundamental types of tower. The designs have been simplified as far as possible in order that the principles may be made plain. Most actual towers are a combination of two of these types, being generally similar to I. or II. across the line and to II. or III. in the line direction. Since as already seen the stresses in

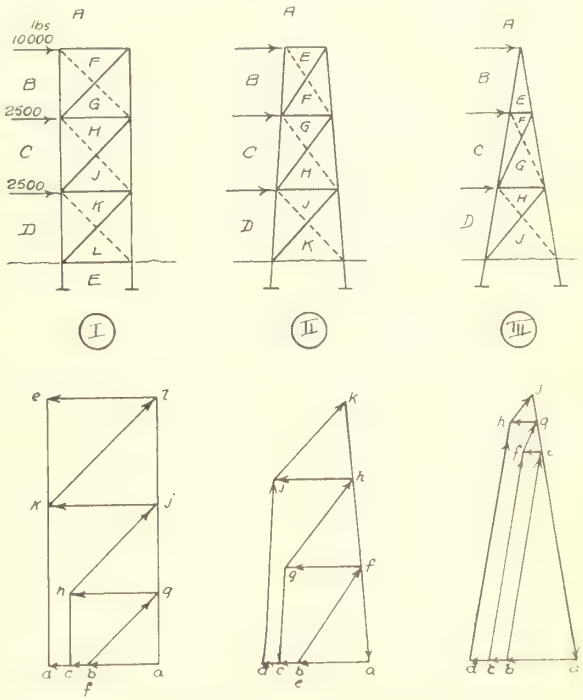

Fig. 11—Structure and stress diagrams for three elementary types of transmission line tower under a distributed (wind) and concentrated (cable) load. Type I requires the strut LE to carry the horizontal load, but this member becomes less necessary and is seldom used with sloping legs. The tension members, shown dotted, of course come into action when the load is on the other side.

this latter direction form the basis of the design, types II. and III. will naturally be of the most interest; however, the main point to observe in reference to Fig. 10 is the manner in which the stresses are accumulated upon the lower section of the tower legs. Fig. 11 brings the matter a stage nearer to actual operating conditions, as, instead of one horizontal test load near the apex of the tower, a slightly smaller load is applied at the same place, together with a dis-

unlimited load due to wind on the structure. This leads to a different distribution of stresses in the bracing, but the main compression load is carried by the lower part of the corner members as before. The bottom horizontal member KL in type I. is dispensed with as being less necessary in the other designs where the sides are battered. However, the lowest diagonal has to carry the same horizontal stress in any case and a danger exists of making the bottom panel between ground and the lowest strut too long for safety. Ten miles of an important transmission line was wrecked in one night owing to too long an unsupported panel causing the tower legs to shut up like a pair of scissors. It is best for the joint between the bottom diagonal and the tower leg to be made about a foot below the ground surface. This enables the horizontal component of the load to be transmitted to the tower leg without any appreciable shear and the practice has been adopted by the Alabama Power Company on their recently erected lines.

Apart from this somewhat troublesome horizontal load, the principal stress in the structure is the compression in the legs, and where other things are equal and the footings are good, the tower will not fail until the main compression angle buckles. To ensure the maximum strength against buckling the legs are frequently cross braced to reduce to a minimum the unsupported length and the ratio of this length to the minimum radius of gyration of the section is kept at the lowest practicable proportion. A ratio of 100 represents good design, and 120 is the maximum desirable. Since r for an equal sided angle is approximately b/5 (where b is the breadth of the angle) then to secure a maximum l/r ratio of 100 the unsupported length must not exceed twenty times the width of the angle. A common size of corner angle for a heavy tower is 4 in. x 4 in. x ¼ in., in which case it will be seen that the maximum length between cross struts should not exceed 80 ins.

Several formulas exist for calculating the buckling stress on a strut and four of those in use for tower work are given below. These are supposed to give the safe load based on a safety factor between two and three:

National Elec. Light Assn. $p = 24000 - 60 \times l/r = 18{,}000$ lb.
Rankine $p = 21500/(1 + l^2/36000r^2) = 16{,}800$ lb.
Alabama Power Co. $p = 25000/(1 + l^2/18000r^2) = 16{,}100$ lb.
European (Tetmajer) Formula $p = 22000 - 81\ l/r = 15{,}900$ lb.

The last column gives the actual stresses obtained by using the formula for a ratio l/r of 100 and it will be seen that there is quite a disparity, which is a good reason for adopting a liberal factor of safety in figuring this stress.

Some idea of the diversity of tower designs is afforded by Fig. 9; however, it will be found on analysis that their design is in every case based upon the principles outlined above. The figure for horizontal load given in this diagram refers to the tension in three conductors for a double circuit tower, and in two conductors for a one circuit structure, except where it is defined as the actual test load.

Flexible towers or A frames, have not been treated in this article; their design is based on the distribution of transverse loads only except for the anchor towers, which are figured like any other four-leg structure. The A frame is based upon the presumptions already mentioned, that in the case of two or more cables failing the load on the support is less than that calculated, because (a) the insulators and tie wires will yield, and (b) the tower will yield sufficiently to equalize the stress, and (c) the remaining conductors and the ground wires will afford stability.

The fourth article in this series will appear in the April 1 issue, and will be entitled "High Voltage Considerations."

What Does Electric Illumination Cost?

Fuel Saving by Curtailment of Light is Very Little in Comparison with the Possible Economies in Other Directions

By Preston S. Millar*

The cost of artificial illumination of all kinds is one-half to two per cent. of the total expenditure of the people. It compares with certain other expenditures as follows:

Illumination	$500,000,000
Liquors	665,000,000
Tobacco	490,000,000

Coal Consumed in Electric Lighting

The significant figures to have in mind when discussing this subject are as follows, all being rough approximations:

Approximate Coal Consumption for 1917

	Tons
Total coal output of the country (United States).	640,000,000
Total employed in production of electric light and power (traction excluded).	36,000,000
Total employed for production of light by electricity	12,000,000

According to these estimates, about 2 per cent. of the coal consumption of the country goes into electric light. Some comparisons may assist to provide a proper perspective for the consideration of these data.

	Tons
Coal shortage the equivalent of which must be saved	50,000,000
Estimated saving in coal during 1914 if all private plant power could have been replaced by central station power	13,000,000
Estimated saving in coal by maintaining temperature of building interiors at 67 degs. F. instead of 70 degs. F.	10,000,000

It is evident, therefore, that the total consumption of coal in the production of all electric light is relatively not a very large item in the coal consumption of the country. If the entire electric lighting of the country were cut off the saving in coal would be only twenty-four per cent. of the required saving, and no more than would be accomplished by a reduction of readily practicable extent in the heating of buildings. In considering lighting curtailment, therefore, it is important to bear in mind that even if every candlepower of electric lighting were wasted the loss of coal involved would not be the great outstanding coal waste of which this country is guilty. As relatively little light is wasted, it is evident that the amount of coal which can be saved by curtailment of electric lighting is small. Our discussion has to do with the saving which it may be possible to effect in the 2 per cent. of the country's coal which is consumed in electric lighting.

Present Status of Artificial Lighting

Before the present period of fuel stringency, the employment of artificial light had increased rapidly. In some classes of service it had attained a stage which in the present state of the art was considered by experts to be reasonably satis-

* Before Illuminating Engineering Society.

factory with respect to intensity, though not so in respect to the manner in which the light was used. Such a condition, however, was exceptional. Upon the whole artificial lighting has been inadequate, considering the best advantages to the public. Safety, conservation of vision, economy in production, commercial success, and aesthetics, singly and in various combinations, require improved utilization of artificial light which in many, if not in most cases, involves the production of more light.

Within the past two weeks the author has requested a number of members of the Society to express their views as to the adequacy of standard lighting practice. The concensus of the opinions secured is presented in the following table:

Classes of Lighting Service	Present Day Ideas of Desirable Practice as Compared with Practice Just Before the War
Street (civic, not white way)	+ 70%
Public Buildings (schools, colleges, institutions, etc.)	+100
Industrial	+175
Protective (outside and inside)	+400
Commercial (offices, stores, etc.)	+ 40
Residence (including hotels, clubs, etc.)	+ 30
Recreational (churches, theatres, saloons, etc.)	0
Advertising (signs, white way, show windows, etc.)	0
Miscellaneous	+100

Assuming a distribution of illumination among the several classes of lighting service named it develops that according to the consensus of opinion of these 10 men, electric lighting as a whole ought to be increase by about 73 per cent. in order to conform to the concensus of their opinions as to desirable intensities.

In relatively few instances has more artificial light been employed than the circumstances warrant. There is occasionally encountered a popular opinion that artificial light is used more largely than is necessary. The phrase "over illumination" appears to have found some place in popular parlance. The origin of this impression is to be found not in the use of too much artificial light, but rather in the glare of exposed light sources which are excessively bright and which create the impression of high illumination. Good illumination involves correct practice in respect to intensity, diffusion and color of light. When the artificial illumination is correctly designed as to diffusion and direction, there is no suggestion of over illumination. To talk of over illumination by artificial light is unreasonable, in view of the fact that intensities range from, say, a minimum of 0.01 foot-candle outdoors to a maximum of 5 foot-candles indoors, while sunlight as we employ it ranges from, say, 10 foot-candles indoors to a number of thousands of foot-candles outdoors. How then is it possible to speak of over illumination by artificial light, when the brightest artificial illumination is only, say, one-quarter of the least bright sunlight which is used for the same purpose within buildings?

Let us base our consideration firmly upon the fact that indiscriminate curtailment would involve reduction from lighting standards which are less than adequate.

Estimate of Practicable Curtailment

The author has prepared the following rough estimates of the manner in which artificial light is distributed among the several classes of service adopted as a classification for this purpose. There are no general statistics on this subject. Some fragmentary data and the opinions of several men engaged in the lighting business have been obtained. It is to be emphasized, however, that these figures should not be accepted as anything more than very roughly approximate.

Beside these figures showing approximate distribution of lighting among several classes of service are figures representing the concensus of opinion of ten qualified observers as to the extent to which lighting in each class of service ought to be curtailed or increased in the present emergency. The values are probably reasonably indicative of expert opinion on this subject at the present time.

Adjustment of Illumination Intensities which According to Expert Opinion Ought to be Made from Standards Existing Before the War in View of the War and the Fuel Shortage

Class of Lighting Service	Per Cent. Distribution	Desirable Adjustments in Intensity
Street	15	— 50
Public Building	3	— 10
Industrial	18	+ 50
Protective	1	+200
Commercial	20	— 20
Residence	26	— 20
Recreational	7	— 40
Advertising	5	— 80
Miscellaneous	5	— 10
	100%	Net — 7%

The final adjustment of artificial light which ought to be made at the present time depends on the one hand upon the need for obviating extravagant lighting and eliminating waste, and on the other hand upon the importance of promoting industry and safeguarding lives and property. The net adjustment based upon the estimates and opinions summarized in this table, appears at the foot of the table and is of the order of —7 per cent. Adjustments in particular classes of service range from a maximum curtailment of —80 per cent. in advertising lighting to a maximum increase of + 200 per cent. in protective lighting.

One may ask why this net saving should be adopted as the conclusion from this survey instead of 17½ per cent., which is the gross saving from which no deduction is made to cover the desirable increases. The author would consider himself unworthy to discuss this important subject before the Illuminating Engineering Society, if he failed to insist that except in the presence of an actual coal shortage which could not be compensated by saving elsewhere, the increases in intensities which are recommended for certain classes of service are more important to the public welfare than is the coal saving which it is desirable to effect in other classes of lighting service. The net saving, therefore, is the value which should enter into our calculations.

It will be recognized that both the extent of lighting and the level of illumination intensity in each class of lighting are involved in this survey. In protective lighting, for example, it is a more extensive application rather than higher intensity which is required. In industrial lighting, on the other hand, higher intensities are deemed advisable.

Desirable readjustment of artificial lighting to meet war conditions and to assist in meeting the coal shortage, consists, therefore, in eliminating extravagant and unnecessary light, in reducing the intensity in a few places, in increasing the intensity in a few classes of lighting and in extending lighting in other classes of service.

Methods of Lighting Curtailment

Various methods of reducing artificial lighting as a war measure have been proposed as follows:

1. Remove unnecessary lamps.
2. Extinguish all lamps when they are not needed.
3. Extinguish some of the lamps when possible.

(1) Substitute smaller sizes of lamps.

(2) Replace inefficient by efficient lamps.

Other Means of Saving Fuel

To arrive at suggestions for saving fuel used for lighting purposes without deleterious effect, one should consider the elements of inefficiency in lighting, and the possibility of eliminating them. Such a line of consideration brings the following to the fore.

Good Utilization of Light.—Selection of suitable reflectors or other lighting accessories may in some cases make it possible to provide equally good illumination while using smaller or fewer lamps.

Good Maintenance.—Dirt cuts down lighting efficiency markedly. Statistics are available to show that cleaning of lamps and lighting accessories has increased the useful illumination by as much as one-third. It is reasonable to state that the difference between good and poor maintenance of a lighting system will account for 20 per cent. of the total light.

Use of Good Reflecting Surfaces.—Good white paint or other good light reflecting surfaces conserve light materially. Sometimes a wall or side of a building may be whitewashed with the result that more daylight is reflected into an interior, thus reducing the use of artificial light.

Other measures which are attracting favorable consideration but which are not within the scope of illuminating engineering, include the following:

Daylight Saving.—The adoption of summer daylight saving as now proposed is estimated to be capable of reducing the coal consumption of electric central station steam plants by 230,000 tons per annum for the entire country. A suggestion to advance the period of activity by one hour the entire year round, which is now attracting considerable attention, is estimated to afford about the same saving to the public in lighting bills, but to result in a somewhat greater saving of coal on account of the more favorable load factor for power plants which would result in the winter months.

Utilization of Water Power.—It is estimated that only about one-tenth of the available water power of this country is developed. Most of the remainder is in the western states. Much of it is remote from centers of population. All will require time for development after legislative impediments shall be removed. It is clear, however, that tremendous reductions in coal consumption may be effected in the future through further utilization of our water resources.

Elimination of Small Power Plants.—The inherently lower efficiency of small plants, together with the less expert operation which in general they receive, is estimated to be responsible for the use of one-third more coal than necessary. This element of waste is even more serious in England than in this country, as is evidenced by a recent report (April 16, 1917) of the Coal Conservation Sub-Committee of the Reconstruction Committee, in which, after pointing out that the average capacity of English generating plants is 5,000 h.p., it is stated that "The present coal consumption if used economically would produce at least three times the present amount of power."

Coal Saving Through Curtailment of Electric Light

It has been shown that the net reduction in the use of electric light which in the view of lighting experts it is desirable to make in the present circumstances of war and coal shortage is of the order of 7 per cent. of the total electric light produced. If a proportional amount of coal saving be assumed, this would mean a reduction in coal consumption of 840,000 tons per annum. This is the maximum extent to which it is saved through electric lighting curtailment. Such a saving compares with other possible annual savings as follows:

	Tons
Total saving which must be accomplished	50,000,000
Net saving thought desirable through curtailment of electric lighting	840,000
Saving if one degree lower temperature is adopted for building interiors, i.e., 69 degs. instead of 70 degs. F.	3,000,000
Saving if each family decreased by one shovelful its daily use of coal	15,000,000

The saving which is possible in the heating of buildings looms large. Our practice in this respect is to heat buildings to a considerably higher temperature than is done in Europe. The coal which might be saved by operating buildings at the temperatures which prevail in Europe instead of at the temperatures which we effect, would be more than the equivalent of the entire consumption of coal in electric lighting. Even the saving of one shovelful of coal per day makes any practicable saving through electric lighting curtailment seem very small.

This relatively small quantity of coal may be saved through curtailment of electric lighting at the expense of a certain amount of damage to business. The business of those who depend upon this form of advertising will suffer and the revenues of the lighting companies and of manufacturers of lighting appliances will be reduced. If it shall be decided that the best interests of the country demand that this relatively small amount of coal be saved at the expense of damage to business there is every reason to anticipate ready and unquestioning compliance on the part of those affected. In view, however, of the much larger savings of coal which may be affected in other ways it is to be hoped that the relative disadvantages of saving these 840,000 tons through lighting curtailment and through other means will be weighed most carefully.

As to accomplishing greater savings of coal through even more extensive curtailment of lighting it must be remembered that general reduction beyond the amount approximated in the cencensus given above would be at the expense of diminished safety, reduced production and impairment of vision. It would put in jeopardy the results of the work of this Society in bringing standards of artificial illumination up toward the place where the best interests of the public will be served. In the author's judgment such curtailment would be wise only if the coal shortage should become so acute that distinct impairment of the human energy of the country would be preferable to the use of the amount of coal involved.

Conclusions

The Fuel Administration in the performance of its tremendously difficult and delicate task has evidenced a desire to avoid damage to business wherever possible. At the same time it has rightly insisted upon economy in the use of fuel and upon the elimination of waste. While it appears that rather more attention has been devoted to the reduction of fuel consumption through the curtailment of light than the importance of this among the other means of saving coal would warrant, yet the lighting industry, like other business interests, has manifested a desire to do its bit cheerfully, and has sought to carry out the letter and the spirit of all regulations. The author's point of view, as stated in the introduction to this paper, is predicated upon the superlative importance of winning the war and upon the importance of economy as a means to that end. Accordingly this discussion has sought to emphasize all methods of curtailing the use of light which are believed to be promotive of ultimate economy and to be free from consequences which are of

Electric Railways

Steam Railways Use 25 Per Cent. of Total Fuel Mined—If Electrified This Could be Reduced by Two-Thirds—Great Economies Possible in This Direction

Mr. E. W. Rice, president of the General Electric Company, and also of the American Institute of Electrical Engineers, speaking of the coal shortage of the last two months and its relation to the development of our water-powers and the electrification of our railway systems, pointed not only to the saving that might be effected in coal consumption, but dwelt also on the greater capacity of our railways as at present equipped with rolling stock if they were operated by electric power instead of by steam. Much has been said about the saving to be made through cutting down our use of lights, which is responsible for something less than 2 per cent. of our total coal consumption, but Mr. Rice pointed out that our railways are consuming about 25 per cent. of the total coal mined, and that this is operating under such inefficient conditions that it requires 6 pounds of coal to produce 1 horse-power hour. It follows that if this equipment were replaced by electric traction with three times as high an efficiency, a saving of 16 2/3 per cent. of the total consumption of coal would be effected in one item—many times the possible saving if all our lighting systems were eliminated altogether. Some interesting extracts from Mr. Rice's address are given herewith:

We are now in the midst of an extraordinary coal famine, due to causes which it is unnecessary and perhaps undesirable for us to attempt to outline. However, I would like to point out in the first place how much worse the situation might have been were it not for the contributions of the electrical engineer and manufacturer; and, second, how much better our condition might have been if our contributions had been more extensively utilized.

Electricity in Coal Mines

Suppose we assume that the present serious situation is due to a lack of production of coal. It is comforting to consider to what extent conditions surrounding such production have been improved and how the amount of coal mined has been already increased by the use of electrical devices in connection with coal mining—such, for example, as the electric light, electric coal cutters, electric drills, and electric mining and hauling locomotives. I have no figures before me, but I think it is a fairly safe assumption that the amount of coal mined has been increased at least 25 per cent. on the average by the employment of such electrical devices. If this estimate were cut down to 10 per cent., it would still leave an increase in the tonnage of coal produced of something like 50,000,000 tons during the past year.

If, on the other hand, the difficulty is not due to a shortage in the production of coal, but rather to the failure of the distributive agencies of the country, it is interesting to see how this difficulty would have been largely removed if the railroads of the country were operated by electricity instead of steam. Where electricity has been substituted for steam in the operation of railroads, 10 to 50 per cent. increase in actual capacity of existing tracks and other facilities has been demonstrated. This increased capacity has been due to a variety of causes, but largely to the increased reliability and capacity, under all conditions of service, of electrical locomotives. This has enabled a speeding up of the train schedules by some 25 per cent., under average conditions. Of course, under the conditions which prevail in extreme cold weather, when the steam locomotives practically go out of business, the electric locomotives make an even better showing. It is, therefore, not too much to say that if the roads of the country were now electrified no breakdown of our coal supply, due at least to failure of distribution, would exist.

The terrors of these "heatless days" will not have been without benefit if they direct the attention of the people and of our lawmakers to the frightful waste of two of our country's most valuable assets—our potential water-power and our coal reserves. The first, potential water-power, is lost because it is allowed to run to waste, undeveloped, unused. The second asset, coal, is wasted for exactly the opposite reason. It is being used, but in a frightfully ineffective and inefficient manner.

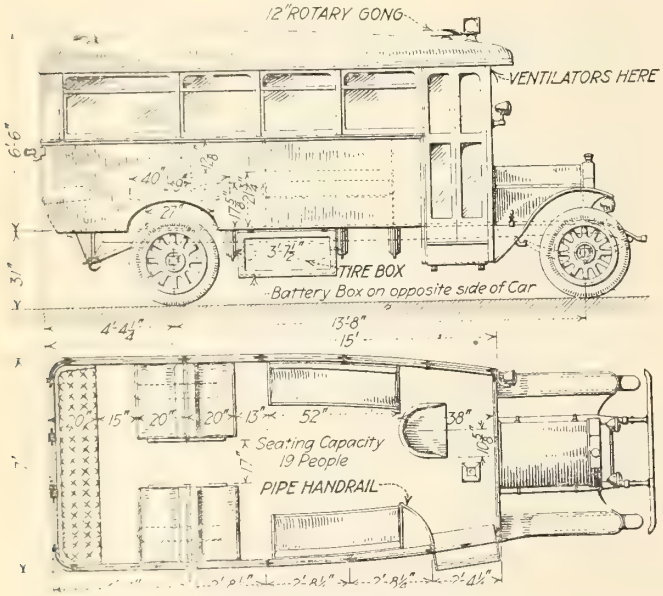
The waterfalls constitute potential wealth which can only be truly conserved by development and use—millions of horse-power are running to waste every day, which once harnessed for the benefit of mankind become a perpetual source of wealth and prosperity.

A Tremendous Coal Waste

It is really terrifying to realize that 25 per cent. of the enormous amount of coal which we are digging from the earth each year is burned to operate our railroads under such inefficient conditions that the average of six pounds of coal is required per horse-power hour. The same amount of coal burned in a modern central power station would produce equivalent to three times that amount of power in the motors of an electric locomotive, even including all the losses of generation and transmission from the source of power to the locomotive.

Where water-power may be utilized, as in our mountainous districts in the West, all of the coal used for steam locomotives can be saved. In the Middle Atlantic States, however, water powers are not sufficient, and it will be necessary in a scheme of electrification that the locomotives be operated from steam-turbine stations.

We should not be justified in being so confident of the benefits of electrification of railroads if every element in the problem had not been solved in a thoroughly practical manner. The electric generating power stations, operated either by water or by steam turbine, have reached the highest degree of perfection, efficiency, and reliability, while the transmission of electricity over long distances with reliability has become a commonplace.



It may be said that the present is not a propitious time in which to deflect any of the country's capital into railroad electrification. I think that, in spite of the enormous advantages of which I have spoken, we should be inclined to agree

with such a point of view if it were not for the recent unpleasant demonstration of the apparent failure of our railroad transportation systems to meet the demands which have been placed upon them by the industries, aggravated, it is true, by the war conditions and also by the unkindness of the weather.

What assurance have we that the present conditions are temporary, and, even if they improve, as they surely shall with the coming of warm weather, what are we going to do next winter?

The Autobus as a Feeder for Electric Railways

While not in all cases satisfactory from a financial point of view, auto buses have proved very useful at many points in the United States where the transportation problem is urgent for consideration but where traffic does not yet warrant the extension of existing electric railways. In other words, as a choice between two alternatives the auto bus is the lesser evil. The Municipal Railway Company of San Francisco, on January 15, this year, put in service a bus system to serve as a feeder to one of its car lines from an outlying residential section. This is described by Mr. N. Eckart, railway engineer, San Francisco Board of Public Works, in the Electric Railway Journal. For the present the buses operate over two routes—one and two miles in length respectively. On both lines the route is paved, except for a half-mile of oiled macadam. Two buses maintain a ten-minute headway on the two-

Auto Bus used by Municipality of San Francisco

mile line, and a single bus runs on a fifteen-minute schedule on the other. The average speed is twelve miles per hour. Two buses are kept in reserve in case of breakdown among the other three.

The buses, which are arranged to seat 18 passengers and will carry as many more standing, are of the p.a.y.e. type, designed for one-man operation. They are mounted on White one-ton chassis, and are equipped with 37 x 5 in. pneumatic tires, single on the front and double on the rear. The buses are 15 ft. long, 7 ft. wide, and have a wheel base of 13 ft. 8 in. The weight, light, is 7,830 pounds. They are fully enclosed, with drop sash, and finished in harmony with the municipal electric cars. The cost was $5,624 each, fully equipped.

In the final acceptance test the performance was as follows on a run of 103.7 miles: Fuel consumption (gasoline at 9 cents per gallon, wine measure), 15 gallons, or 6.9 miles per gallon (the bid guarantee was 6 miles per gallon); total elapsed time, including 361 full stops of ten seconds each, eight hours and twenty-five minutes, or an average speed of 12.33 m.p.h. (the specifications called for 12 m.p.h.). The conditions of the above test were that the bus be loaded 4,000 pounds above standard equipment, and that the speed could at no time exceed 20 m.p.h. The test course was so selected as to represent average city conditions and included grades up to 10 per cent.

Quebec Railway Plans Campaign

At a meeting of the directors of the Quebec Railway, Light, Heat, and Power Company, held recently, plans were discussed for increasing the company's sources of revenue. Mr. W. J. Lynch, general manager of the company, outlined the plans, which consist of an extensive propaganda to advertise the company's power facilities with a view to enticing Western capital into the Province of Quebec, particularly on the company's lands in and around the city of Quebec, the idea in view being the furnishing of power to the industries backed by the capital so attracted.

The company has water-powers at Montmorency Falls, the Natural Steps just above the falls, at Chaudiere Falls, and on the Jacques Cartier and Ste. Anne Rivers. The total amount developed is 48,000 h.p., and there is stated to be further power available to the amount of 25,000 h.p., with an additional 3,000 h.p. when the proposed dam on the Jacques Cartier River is completed. At the present time the company has a surplus of 15,000 h.p. "With coal at prices ranging from $8 a ton up," said Mr. Lynch, "the cost per 24 hour h.p. is now about $76, as compared with $35 to $45 for electric power, according to the amount taken. The ever-increasing difficulties in the matter of coal supply also tend to throw a very favorable light on hydro-electric power, inasmuch as the manufacturer may contract from three to ten years ahead for his power and know exactly what it is going to cost him."

Mr. Lynch further stated that the company were going to conduct a vigorous electric heating campaign in the city of Quebec, from which a revenue of $700,000, at least, could be anticipated. Sir Rodolphe Forget, president of the company, is placing before the Dominion Government a proposal that the company electrify the new Quebec Bridge and take all trains across by means of electric locomotives. This would relieve materially the damage to the structure caused by smoke and steam from the coal locomotives. It was pointed out that it would cost the government more for painting the bridge under present conditions than would be paid to the Quebec Railway, Light, Heat, and Power Company for electric service.

The Winnipeg Railway Situation

At a recent meeting of the Winnipeg City Council, called to discuss the transportation question, Mr. Edward Anderson, K.C., solicitor for the Winnipeg Electric Railway Company, stated that the company is losing approximately $400,000 yearly owing to jitney competition, increase in operating costs, and so on. Expenses have grown from $1,369,000 in 1913 to $1,762,000 in 1917. In discussing the jitney question, Mr. Anderson pointed out that the city's contract with the company gave his clients exclusive right of transportation on the streets of Winnipeg, with the exception of that provided by animal-drawn vehicles. The contract called on the company to build and maintain a large proportion of the width of the streets. Further, the company had to keep this clear of snow. He pointed out that after a snowstorm it could be noticed that the only part of the road used by the jitneys was that cleared by the company's sweepers, and it was obviously unfair that they should have to clear the pavement to allow their opponents to operate. A serious financial crisis was averted in January only by personal guarantees of some of the directors. Mr. Anderson stated he understood there was not another large city on the American Continent where the jitneys have not been abolished or will be very shortly.

The Dealer and Contractor

Essence of Address Before the Toronto Electrical Contractors' Association, at Their Dinner, Thursday, Feb. 7, by H. A. Beach, credit manager, Northern Electric Company, Toronto

The rough pencil sketches used by Mr. Beach are reproduced herewith to facilitate the discussion which is to be continued on March 7.

The importance of an adequate and efficient accounting scheme, especially adaptable to the smaller contractor, has been, I believe, the subject of discussion in your association for quite some little time. On November 1 last, when I had the pleasure of addressing some of the members of this assemblage on a subject which I chose, as "The Relationship Between the Contractor and Credit Man," I felt somewhat flattered being asked at that meeting to lead a discussion on the matter of an accounting system for the smaller contractor. Since then an important court case has resulted in an amendment of the statutes, dealing with the "proper books of accounts," and, through the courtesy of the mailing department of your association, we have given you a copy, on a postcard, of this amendment. I am sure, in reading this over, you will realize now more than ever the absolute necessity and the importance of maintaining a proper set of books.

It was not anticipated, I am sure, by any one of the members that the proposal of a subject for discussion would have developed into one of such apparent interest, for the simple reason that to go into the matter as thoroughly as it necessitates would require quite some length of time. However, for the purpose of this meeting and considering the comparatively short time at our disposal, we have deemed it a matter of expediency to present this subject to you in the shape of diagrams, that you can all see, and which are facsimiles of the forms suggested.

I want to emphasize the expression of "suggested," as it was not my intention to present this as a matter of authority in any way, because we have undoubtedly with us to-night representatives of larger business, those especially who have outgrown the smaller system, and we expect they have profited by their experience in the kindergarten, so to speak, of electrical bookkeeping. Therefore, we ask for your honest criticism, and solicit your help in our demonstration.

Success Depends on the Operator

First of all we must attach importance to the fact that System means order, carefulness, and accuracy, or, in one phrase, a complete understanding of one's business and a definite knowledge of one's affairs at any time. In preparing these forms I have endeavored to keep foremost in my mind, as the principal features, the simplest competent method which is economical both in cost and labor saving. Of course, it is conceded that any system, no matter where it is employed, is to a great degree successful only by the operator.

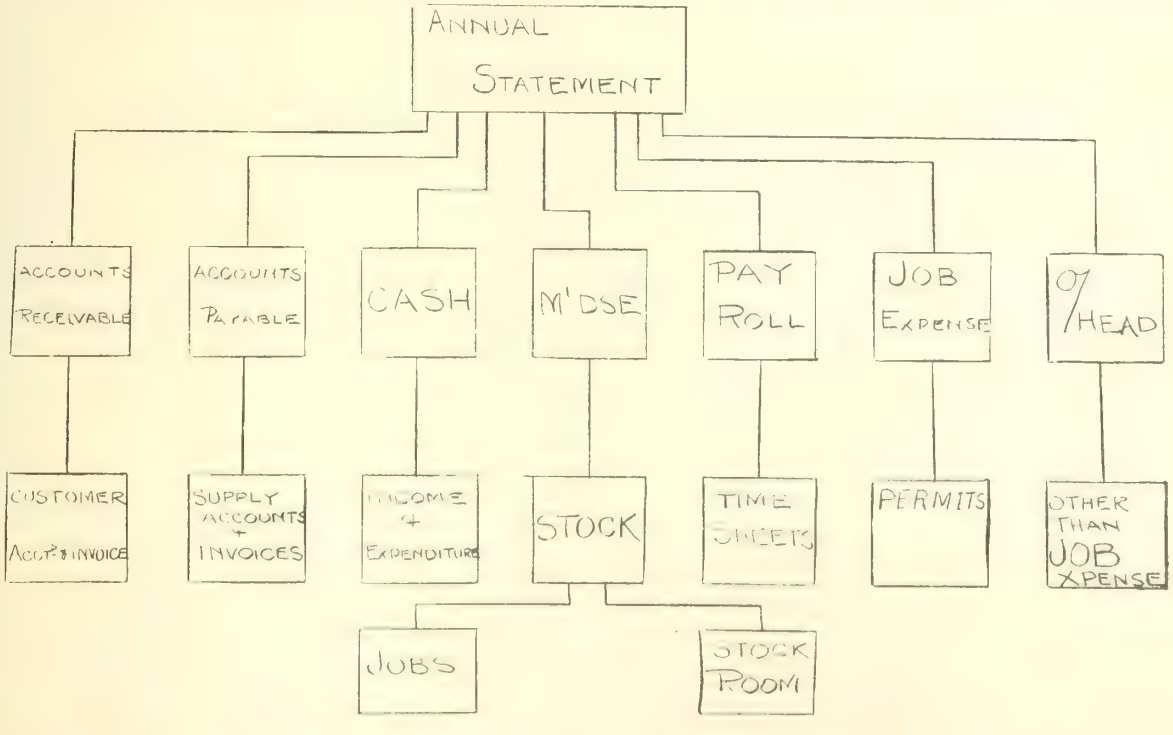


Fig. 1—Diagram illustrating the inter-relation of the various elements in the business to the annual statement.

Fig. 2—Daily Cash Sheet, showing state of Bank and Petty Cash Accounts

It is bound to be affected and modified by local conditions, and must be adapted to suit the volume of work required and the time afforded. Inasmuch as these forms are all practical and self-explanatory, we will not spend too much time on the explanation of them, and will accordingly leave a more complete understanding of them to be gained in the different discussions.

However, some of the principal forms that we have used other than those of an ordinary accounting system are the "job and cost record" and "voucher form" (see forms herewith). In connection with the "job and cost record," you will note that we have prepared this form to suit general operations as we find them among local contractors. Its purpose is to give a complete detailed record and cost of each individual job. The intention is that the ruling will appear on both sides of the sheets, thereby enabling more than one form to be used, if necessary, on any particular job. The information shown on the right-hand lower corner are the particulars or "factor" as it is often referred to by manufacturing concerns, is generally added separately on both material and labor. We will leave this one form for another discussion.

I would next, just briefly, touch upon the operations covered by the voucher form. One of the principal duties of this form in connection with "accounts payable" is to eliminate the use of the journal and have this feature of the work performed by a voucher form. It is the intention, for simplicity's sake. to file all invoices in chronological order for each individual supplier, and, at the time of payment period, to summarize these invoices after they have borne their respective approvals and are in line for payment, on the voucher form, making a total of the recapitulation, which, of course, would be the amount of the cheque. This voucher form is forwarded with the cheque to the supplier, who receipts it in the space provided below and returns it to you for filing with invoices. This affords a complete transaction, accessible for ready reference. and posting can be made direct to the ledger, thereby

of a rubber stamp, that can be purchased at a very nominal cost. The impression to be made on the last sheet for this information will give postings to the controlling accounts in the ledger. The line for profits is a matter open for discussion as to whether or not overhead expense, which, by the way, carries the overhead, other than the job expense. The "loading," saving duplication in posting to the journal. This is merely a simplified extraction of the voucher cheque method, with which you are undoubtedly all familiar with, but enables the use of cheques supplied by the various banks.

In order to devote for discussion the remainder of the time allotted to me, I think perhaps it is advisable to bring

these general remarks to a conclusion, but before doing so I would like to propose one subject for discussion—the question of overhead expense and gross profits This, it seems to me, is one of the most vital points in your business to-day. It is surprising what little thought is given to it, for the simple reason, I believe, that a great many of us do not quite realize the proper basis for determining it. One authority goes so far as to say that nine-tenths of the retailers are making less than they think they are, and are always surprised when they find it out. If we can possibly devote a few moments to this question, which, you see, occupies a prominent role in this scheme, I am sure it will be well worth while for any information that may help even only one in our company here to-night. Just permit me to say, as we go over each feature individually, that we take it for granted that each one of you has an accounting method of his own, and this is not an attempt to enforce something on anyone present, but rather the idea is to offer a few helpful suggestions for your approval If one of you derives any benefit by its adoption, either in part or whole, we will indeed feel well repaid for any time that has been spent in its preparation.

Following Mr. Beach's explanation of the various forms, the members entered heartily into the discussion. It was found, however, that it would be quite impossible to co-relate

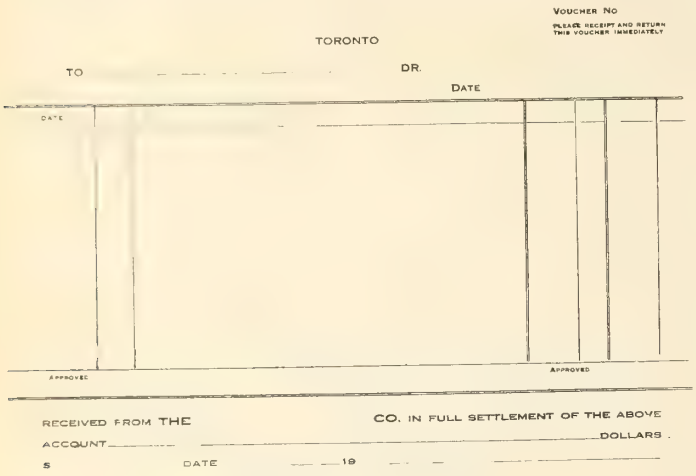

Fig. 6—Payment Voucher

the experiences of all the members at this one meeting, and it was decided that the program for the next meeting, on March 7, should be a continuation of the discussion. It is for this reason and in the hope that it will assist in a proper understanding of the scheme that we are reproducing herewith the six forms recommended by Mr. Beach. It should be distinctly understood that the experience and suggestions of every member of the association are urgently solicited to make the final forms as nearly perfect as is possible. It may be that further simplifications can be made.

The importance of some such system as outlined by Mr. Beach cannot be overestimated. In the interests of the electrical contracting business it is urged that every member of the association will give the matter as much thought in the meantime as possible, and come prepared, without fail, to enter into the discussion at the March meeting.

At the conclusion of the discussion Mr. Beach took occasion to bring to the attention of the members the following set of rules for figuring costs and profits, as recently recommended by the National Association of Credit Men. The suggestions are so good that they are well worth studying.

1. Charge interest on the net amount of your total investment at the beginning of your business year, exclusive of real estate.

2. Charge rental on all real estate or buildings owned by you and used in your business at a rate equal to that which you would receive if renting or lending it to others.

3. Charge, in addition to what you pay for hired help, an amount equal to what your services would be worth to others; also treat in like manner the services of any member of your family employed in the business not on the regular pay roll.

4. Charge depreciation on all goods carried over on which you may have to make a less price because of change in style, damage, or any other cause.

5. Charge depreciation on buildings, tools, fixtures, or anything else suffering from age or wear and tear.

6. Charge amounts donated or subscriptions paid.

7. Charge all fixed expenses, such as taxes, insurance, water, light, fuel, etc.

8. Charge all incidental expenses, such as drayage, postage, office supplies, livery, or expenses of horses and wagons, telegrams and telephones, advertising, canvassing, etc.

9. Charge losses of every character, including goods stolen or sent out and not charged, allowance made customers, bad debts, etc.

10. Charge collection expense.

11. Charge any other expense not enumerated above.

12. When you have ascertained what the sum of all the foregoing items amounts to, prove it by your books, and you will have your total expense for the year; then divide this figure by the total of your sales and it will show you the per cent. which it has cost you to do business.

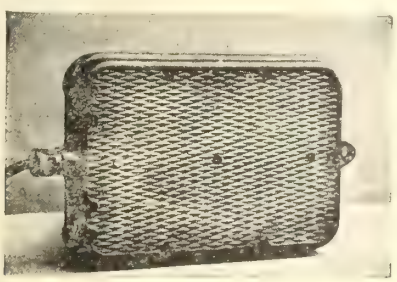
13. Take this per cent. and deduct it from the price of any article you have sold, then subtract from the remainder what it cost you (invoice price and freight), and the result will show your net profit or loss on the article.

14. Go over the selling prices of the various articles you handle and see where you stand as to profits then get busy in putting your selling figures on a profitable basis and talk it over with your competitor as well.

[Note.—"The Electrical News" has been advised since the date of this meeting that already quite a number of contractors are making modifications along these lines. One contractor states he is adopting this scheme, and will report on its practicability to the association.]

Public Being Badly Educated

Manufacturers and dealers are doubtless bearing in mind the recent announcement of the Ontario Hydro Commission referring to the approval of material which will be required after the first of April. It is evident that there is to be a strong campaign launched by the commission with a view to eliminating the present hazards, which will undoubtedly be aggravated in the near future by the increased use of electric heaters and other thermo-electric devices. The commission considers that the general public has been badly educated along these lines in the past by certain indiscriminate advertising that heaters may be used on any key socket. Some of the best heater manufacturers, however, have assured the inspection department of the commission that they disapprove of this method of advertising, and will welcome a proper adjustment of the matter. We understand that the commision will not, in future, approve the apparatus of any makers who advertise that their products may be used in this way, and that a rule is being adopted making such practice an offence. This course is only fair to those manufacturers and dealers who have observed the spirit of the law in the past. It might be a good idea for manufacturers of heaters to get together and adopt a standard form of advertisement, so that the users of apparatus of this kind will readily understand the nature of the device they are using and how it should be used. Safeguarding the public is the wisest course in the long run, and for this reason the commision's move is to be commended. The best results will follow to all concerned if manufacturers, dealers, and contractors assist by a hearty co-operation.

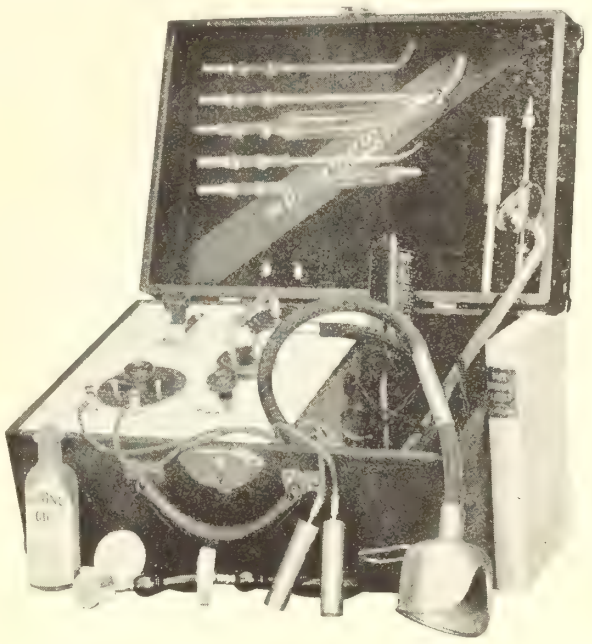


C.G.E. 1918 Fans

A novel feature of Canadian General Electric Company's fans for 1918 is in the finish, as all metal parts are now enameled a dark green, and the blades are lacquered brass. All of these fans are readily adjustable for either desk or bracket use. They are furnished with standard cords and plugs. The complete line of C. G. E. fans for this season will include 9-inch, 12-inch and 16-inch oscillating and non-oscillating four-blade fans in both direct and alternating current. Six-blade oscillating fans in 12-inch and 16-inch sizes are made for alternating current only. Ventilating fans for 1918 will be handled in 12-inch and 16-inch sizes, six blades, in both alternating current and direct current. These fans, finished in green enamel, with lacquered brass blades and trimmings, can also be furnished with special bearings to operate in a vertical position. In standardizing to three sizes of desk and ceiling fans the company's engineers feel that they have provided a fan suitable for every use.

The Hamilton-Beach cyclone universal fan for 1918, sold by the Canadian General Electric Company, is equipped with the H-B universal air-cooled motor, wound to operate on both direct and alternating current at a voltage of from 105 to 120, 60 cycles. This fan is equipped with a rheostat speed control, giving five different speeds and shutoff. It has an extra heavy base, which effectually prevents its creeping, and its design readily permits of its use either as a desk or wall-bracket type.

Foot-Warmer for Outdoor Service



To minimize the discomfort of long standing outdoors in severe weather an electrically heated foot-warmer has just been placed on the market by the Westinghouse Electric and Manufacturing Company. While designed primarily for look-outs stationed in the bow and crow's nest of vessels, the device is applicable to the use of watchmen, sentries, doormen, traffic policemen, and others whose work requires them to be out of doors continuously with little chance for exercise. It has been found that if the rest of the body is adequately clothed, a foot-warmer will ensure comfort at any temperature. As will be seen from the illustration, the device consists of a casting 14 in. by 20 in. by 25 in., with diamond-tread top. This is of cast-iron, or of aluminum where non-magnetic qualities are desired, as in ship service. Against the under surface of this the heater element is clamped. The heater is

a slotted ribbon, clamped between two plates of built-up mica, so arranged as to give uniform distribution of heat. A sheet-steel plate fastened by screws and sealed with high-melting gum renders the entire unit waterproof. The resistance is divided into two parts, which may be connected to draw 200, 100, or 50 watts at 125 volts. A three-conductor cable seven feet long is provided. By using the lower heats in mild weather there is no danger of causing chilblains. It is felt that this heater will add greatly to the comfort, and hence to the efficiency, of men in exposed places, enabling them to do their highly important work of watching and guarding without the distraction of physical discomfort.

Branston Company to Launch National Campaign

The Charles A. Branston Company, Toronto, are putting on a national campaign in the electrical trade to make the period between April 8 and April 20 two "Violet Ray" weeks. Previous to and during this period they will launch a big advertising campaign and supply dealers with special window display and demonstration equipment. They have added several new sets to their line and claim that the Branston line of high frequency generators is now the most complete in Canada. The Branston Company have recently moved into their new factory and are now well prepared to take care of the increased business.

Square D Company Holds Annual Sales Convention

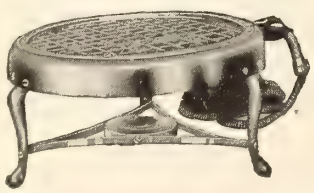
The first annual sales convention of the Square D Company, Detroit, Mich., was held at the Hotel Statler, of that city, January 10, 11, and 12, and was attended by all of their sales representatives from coast to coast, several advertising men prominent in the field, and members of the company's advertising and sales departments. Bryson D. Horton, president of the company, gave the opening address, which was followed by a talk on "The Industrial Plant," by A. MacLachlan, sales manager. L. D. Calhoun, advertising manager, spoke on "Industrial Advertising." Manufacturing and service problems were discussed at the Friday sessions, followed by a dinner at the Detroit Athletic Club in the evening, tendered by Mr. Horton. A trip of inspection through the factory on Saturday and a further discussion of safety switches, their manufacture, and features, concluded the program.

The A. C. Gilbert-Menzies Company

The A. C. Gilbert-Menzies Company has been formed for the purpose of manufacturing certain parts and assembling the A. C. Gilbert lines in Canada. The president of the new company is Mr. A. C. Gilbert with Mr. T. C. Menzies as manager. The new company will maintain the present G. A. Menzies sales and sample room at 439 King Street West, Toronto, and will, in addition, operate a factory for the manufacture and assembly of toys, "Polar Cub" fans, household motors, etc. The Canadian business of the A. C. Gilbert Company has grown rapidly in the past few years, and the present arrangement will allow greater scope for development.

Charles H. Keeling Goes With Square D Company

After years of experience in the electrical field, Charles H. Keeling has joined the selling forces of the Square D Company. He will work this company's Canadian territory, with headquarters at Toronto. Mr. Keeling first went into business in Ottawa, in 1907. For six years he was in the contracting business, and during this time he completed some of the



Mr. C. H. Keeling

largest electrical installations in that city. Prior to accepting his present position with the Square D Company, Mr. Keeling was connected with the Renfrew Electric Manufacturing Company, Ltd., at Renfrew, Canada. He was their first sales representative, and in 1916 was appointed sales and advertising manager of that company. After spending several days at the Square D Company's factory in Detroit to familiarize himself with their safety switch line, Mr. Keeling has returned to Ontario to assume his new duties.

Canadian Beauties for Coming Season

The Renfrew Electric Manufacturing Company are showing a very attractive line of household appliances which should prove to be good sellers during the approaching summer season. The company state that prompt shipment can be made of "Canadian Beauty" grills, toaster stoves, irons,

percolators, upright toasters, and so on. The "Canadian Beauty" 8-inch toaster stove is illustrated herewith.

The Eastern Electric Company

Messrs. Giddings & Sweetnam, Montreal have dissolved partnership, and Mr. C. D. Sweetnam has started business on his own account as the Eastern Electric Company, 131 St. Alexander Street, Montreal, wiring, poles, power plants, switchboard supplies, etc.

Malm, Gordon & Company

The firm name of Theo. Malm & Company has been changed to Malm, Gordon & Co. This is necessitated by the inclusion of Mr. W. G. Gordon in the firm. Mr. Gordon has been with the Canadian General Electric Company for a number of years in charge of their electric railway department.

Trade Publications

Condulet Suggestion—No. 6, by the Crouse-Hinds Company of Canada. This illustrates a system of lighting a textile mill using "Obround" condulets. The conduit system in this installation is supported by uprights fastened to the machines, which brings the system so low that it can be easily kept clean and lamps can be replaced without trouble.

Lighting Publications—The George Cutter Company, of South Bend, Ind., have issued an interesting bulletin, No. 3337, describing "Sol Lux" lighting reflectors and fixtures, schedule "H," effective January 21, 1918. The bulletin is well illustrated, and not only includes some splendid arguments on the value of good industrial lighting, but points out how this may be accomplished under greatly varying conditions. The same company are distributing bulletin No. 3338, describing Cutter "Universal" and "Standard" flood lighting projectors; also well illustrated and containing a quantity of engineering data on flood lighting projectors.

Spraco System—Bulletin No. 202, by the Spray Engineering Company, Boston, Mass. (Rudel-Belnap Machinery Company, Montreal, Canadian representatives), describing the Spraco system for cooling condensing water. In addition to a quantity of interesting illustrations of actual installations, with descriptions, the bulletin contains a number of tables showing results obtained with this cooling system on a typical winter day, a typical spring day, a hot summer day, and so on, all of which bear evidence to the splendid efficiency of the apparatus. An appendix also contains a partial list of Spraco cooling pond installations, which indicates the wide range of industries and territory covered by this company.

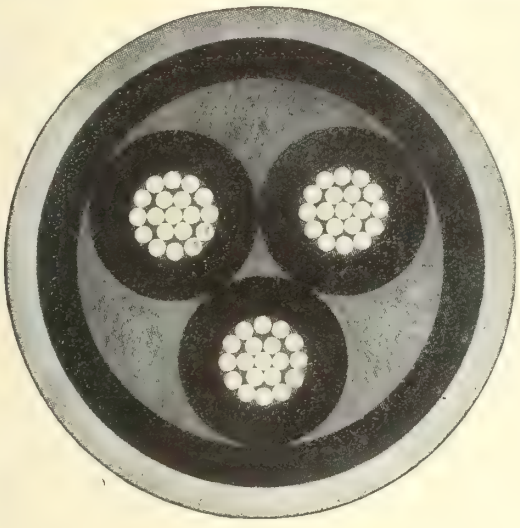
What Does Electric Illumination Cost?

(Concluded from page 32)

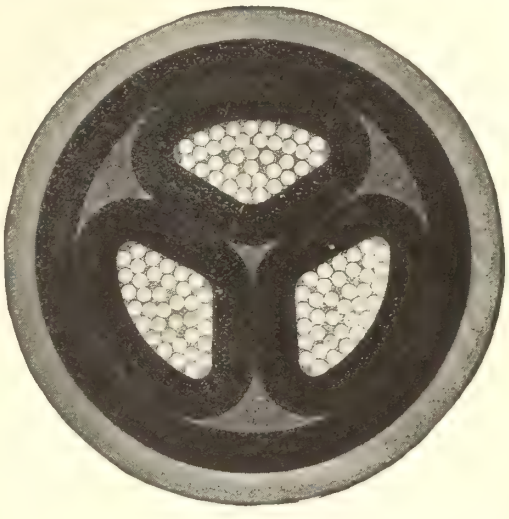
greater disadvantage than the advantage in coal saving which is effected.

If the least disadvantage to the prosecution of the war and to public welfare per ton of coal saved is accepted as the test governing coal saving regulation it is the author's opinion that other means of saving will be pressed more vigorously before lighting will be curtailed beyond the elimination of extravagance and waste.

Such coal as may be saved by the elimination of extravagance and waste should, of course, be saved, and our greatest efforts should be applied toward that end. It would seem, however, that the best way in which the public can assist in saving coal is to devote its attention to coal saving through improved heating, slightly reduced building temperatures, etc. With a given amount of effort and much less disadvantage, many times more coal saving can thus be effected than through curtailment of lighting.



General curtailment of lighting would be a menace. For the last eleven years the Illuminating Engineering Society has devoted a large part of its effort to promoting good illumination. The research and investigation of its members on the effect of light upon the eye; the influence of its technical discussions upon design and installation of lighting appliances; its popular educational campaign in the fundamentals of good lighting have resulted in improvement of lighting practice especially in the more recent installations.



After careful consideration of this subject, including study of the statistics presented in this paper, the author has reached the personal conclusion that to curtail lighting generally would result in damaging the eyesight and impairing the efficiency of our people. He believes that the country cannot afford to incur such a risk for the sake of the small coal saving which may result—a saving which may be accomplished otherwise with much less disadvantage.

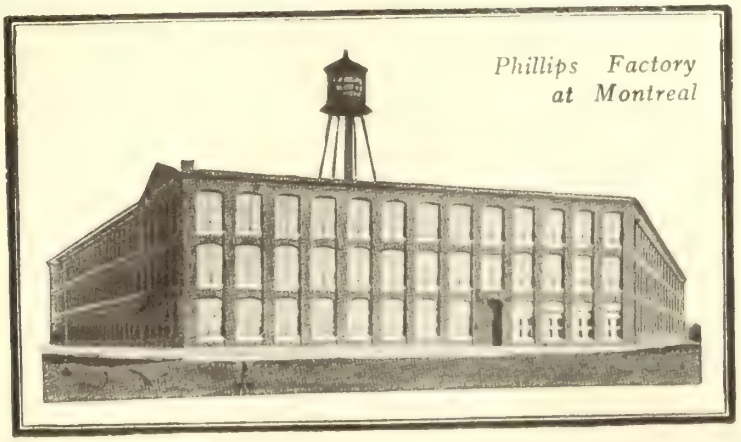
"Business as usual" is not our aim. War makes readjustment of business imperative. Economies must be effected.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in.. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Current News and Notes

Bassano, Alta.

The Town Council of Bassano, Alta., have placed an order for an electrically driven pumping unit, to be installed in the town waterworks.

Brockville, Ont.

An electrical contracting business is being established by Mr. A. P. Louch, of Brockville, Ont.

Chatham, Ont.

An equalizing scheme adopted in Chatham, Ont., for solving the power shortage consists in shutting off domestic circuits in the morning and afternoon, and factories, by agreement, operate only at certain periods of the day. Some of the factories operate at night only in order to still further relieve the situation.

The annual report of the Chatham Public Utilities Commission shows net earnings for the light department of $53,710, as compared with $34,914 in 1916. The net surplus is $119.

Halifax, N.S.

The Maritime Telephone Company, Halifax, N.S., contemplate the erection of a new telephone building.

The City Council of Halifax, N.S., have ordered plans prepared for a modern street lighting system. Tenders will be called shortly.

Melfort, Sask.

The Town Council of Melfort, Sask., have under consideration the installation of a modern switchboard in the electric plant and the construction of power line extensions.

Montreal, Que.

The Western Canada Power Company reports for December operating revenues $38,410, an increase of 1.8 per cent.; net earnings of $30,770, an increase of 22.1 per cent. Twelve months' operating revenues, $450,161, an increase of 20 per cent.; net earnings of $332,194, represent an increase of 28.1 per cent.

The Davies-Clayton Company, electrical contractors, Montreal, have registered.

Gross earnings of the Dominion Power and Transmission Company for the year ending 1917 amounted to $2,967,273, while operating expenses totalled $1,733,759. Net profits were $726,219, which added to the previous balance of $536,065 made the total surplus at the end of the past year $1,262,284.

Newmarket, Ont.

The Fire and Light Committee of Newmarket, Ont., have announced an approximate 10 per cent. reduction in light and power rates. The town secures power from the plant of the Toronto and York Radial Railway Company and the new rate will be 1½ cent per kw. h. on all current consumption over 25 kw. h.

Port Dover, Ont.

The Town Council of Port Dover, Ont., are negotiating with the Hydro-Electric Power Commission of Ontario in connection with securing a supply of Hydro power.

Pembroke, Ont.

The Pembroke Electric Light Company, Ltd., which will very shortly have sufficient power for all purposes, is undertaking a publicity campaign. Literature is being prepared setting forth the advantages the town offers for manufacturing purposes; local business men will be asked to circulate this matter by enclosing copies in their out-of town letters.

Regina, Sask.

A straight 5-cent fare has been adopted by the Regina municipal railway system. Tickets may be purchased, but there will only be five for a quarter. The price of labor tickets remains unchanged, although their use in the evening hours is prohibited. Children's tickets remain at the old price, 10 for 25 cents.

St. Catharines, Ont.

The annual statement of the St. Catharines Hydro-Electric Commission shows total earnings of $117,100, as compared with $78,814 in 1916. The net surplus for the year was $22,980. as compared with $10,423 in 1916.

Toronto, Ont.

The first prosecution in Toronto for failure to obey the power controller's order regarding window lighting was made a few days ago, the defendant being fined $50.

Personals

Mr. C. Barthe has been appointed superintendent of supply sales of the Canadian General Electric Company, Montreal, in succession to the late Mr. C. B. Ellis.

Mr. E. L. Milliken, manager of the Cape Breton Electric Company, of Sydney, N.S., since 1912, has accepted a similar position with the Houghton County Traction Company, in Northern Michigan. He went with the Cape Breton Electric Company in 1908 and served in various capacities until his appointment to the managership in 1912.

Mr. W. G. Gordon has resigned from the Canadian General Electric Company, with whom he has held the position of Transportation Engineer for over four years, and is entering into partnership with Mr. Theo. Malm in the Railway and Power Engineering Corporation, and in Malm, Gordon & Company, engineers. Mr. Gordon has had wide experience in connection with not only city and interurban electric traction, but also with trunk line electrification. After graduating from Cornell in electrical engineering in 1899, he entered the testing department of the General Electric Company at Schenectady. While in the railway construction department of this company he had charge of the installation of the first electrically operated train on the Manhattan Elevated, New York, and, later, of the installation of the first multiple unit equipments for the Northwestern Elevated, Chicago, Aurora, Elgin and Chicago Railway, Lake Shore Electric Railway, etc. Following this, while in the railway engineering department at Schenectady, he was closely associated with the further development of multiple unit operation for the New York Central lines and the Interboro Rapid Transit Company. For a number of years Mr. Gordon was in Australia in the General Electric Company's interests, where he was manager and engineer of the North Melbourne Tramways and Lighting Company, Limited; later engineer for the National Electrical and Engineering Company, Limited, handling the New Zealand business for the General Electric Company, and finally engineer for the Brisbane Tramways Company, Limited, until his return to Canada. He is a son of the late principal of Queen's University, Kingston, Ont., Rev. Dr. D. M. Gordon. He is a Fellow of the A.I.E.E. and is on the Traction and Transportation Committee of the Institute.

Railway, Light and Power Equipment

Let us quote you on the following Equipment and Supplies

WE REPRESENT

Bates Expanded Steel Truss Company
CHICAGO, ILL.
Steel Poles for Railway, Light and Power Purposes. Outdoor Type Substations.

Catskill Foundry & Machine Works
CATSKILL, N.Y.
Steel Gears and Pinions

Columbia Machine Works & Malleable Iron Co.
BROOKLYN, N.Y.

CAR EQUIPMENT

Armature and axle bearings
Armature and field coils
Bearings (bronze and iron)
Brush-holders and brush holder springs
Brake, door and other handles
Brake forgings, riggings, etc.
Car trimmings
Commutators
Controller handles
Forgings of all kinds
Gear cases (steel or malleable iron)
Grid resistors
Third-rail shoe beams and accessories
Trolley poles (steel) and wheels

TOOLS

Armature and axle straighteners
Armature shaft straighteners
Armature buggies and stands
Babbitting molds
Banding and heading machines
Car hoists
Car replacers
Coil taping machines for armature leads
Coil winding machines
Pinion pullers
Pit jacks
Signal or target switches
Tension stands

Special Shop Working Tools.

Laclede Steel Company
ST. LOUIS, Mo.
"Electroheat" Axle and Armature Shafts of all types and sizes. "Electroheat" Annealed side rods, main rods, crank pins, piston rods. All kinds of "Electroheat" Forgings, etc.

Morgan Crucible Company
NEW YORK
Carbon Brushes.

Railway Track Work Company
PHILADELPHIA
The Reciprocating Track-Grinder.

Westinghouse Electric and Mfg. Company
PITTSBURGH, Pa.
Trolley and Catenary Construction Material.

We also handle electric passenger, freight, and express cars and locomotives of all types and descriptions.

Keep this list before you whenever you are in the market for equipment and supplies.

All engineering service without obligation. List will be continued in next issue.

CITY OF CALGARY

Sealed tenders, marked "Tender for One Motor Generator Exciter Set," addressed to the City Commissioners, will be received by the undersigned up to twelve o'clock noon of Tuesday, March 12th, 1918.

Specifications can be received from

J. M. MILLER,
City Clerk.

VIOLET RAY

Campaign Weeks April 8th to 20th

The Branston Violet Ray — High Frequency Generator

Have a Violet Ray Campaign in your store during the two weeks of special selling, April 8th to April 20th. Our tremendous advertising campaign will create a bigger demand than ever for Branston Violet Ray Generators all over the Dominion. Thousands of Generators are now being sold and every one is an advertisement in itself. We realize this fact, and have proven that special demonstrations arouse a great deal of interest—Lead to many sales—Make satisfied customers—**Increase your profits.**

We are running full page advertisements in the leading magazines, calling attention to the Branston Violet Ray Demonstration in your store. If you are not at present a Branston Violet Ray dealer, write us today and get in on this.

We are preparing attractive complete Window Trims, Display Cards and Streamers, Lantern Slides for the Movies—Catalogs and Special Folders, Advertising Electrotypes for your local newspaper. —Every medium that will assure profitable results to dealers. It will make your store better known.

Reap the full benefit of the Campaign. Co-operate with us during this campaign. Put in a good window of Branston Violet Ray Generators. Use the window trim we supply you.

SPECIAL REDUCED PRICES ON OUR MODEL 7 GENERATOR FOR THIS DEMONSTRATION

Remember the Dates! Branston Violet Ray Weeks—April 8th to April 20th

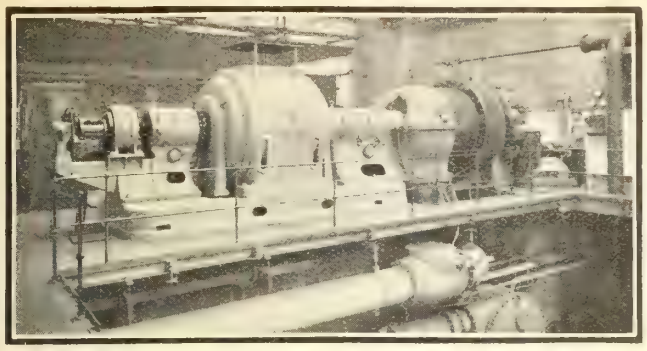
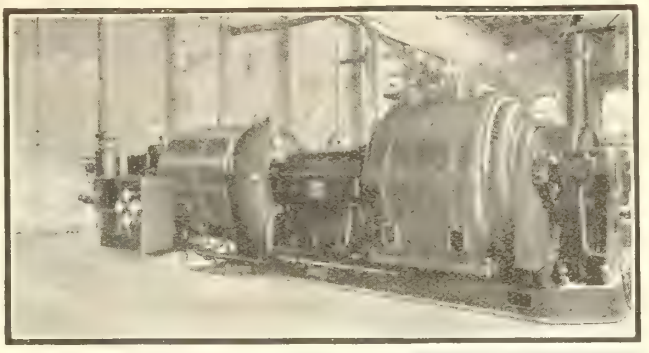
The famous "Drop-Out" Renewal Link can be had only in
ECONOMY renewable FUSES



This link is responsible for the saving of 80% of the annual fuse maintenance cost.



We are pioneers in the manufacture of renewable fuses. We have blazed the trail and staked our claims. The vital features of renewable fuse efficiency are protected by Economy basic patents. Imitations are by no means duplications.

Sole manufacturers of "Arkless"—the Fuse with the 100 indicator. For circuits not subject to frequent overloads this is the logical fuse. This and the Economy together meet *all* fuse requirements.

Be prepared to handle the business that our extensive consumer advertising will bring to you. Write for Catalog 20 and free samples.

WHITE'S PORCELAIN STRAIN INSULATORS

You want strain insulators that are strong physically, that stand up under the exceptional conditions of the heavy storm; that hold up under a load of sleet; that don't crack when the thunder rolls, the lightning flashes, and the wind whistles.

This is the kind of strains T. C. White Company is making of porcelain in a variety of sizes for different loads, and several designs for varying conditions.

It will pay you to write for bulletin which shows designs and gives the complete data on strain and electrical tests.

Write today.

"STANDARD WIRING"

TELLS YOU HOW

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or for A. C. single, two or three-phase.

OUTSIDE WIRING—Pole line construction, line wires, service wires, roof structures, poles and their dimensions and weights, and how to erect and protect them and wires they carry. Insulators, guard arms, guy anchors. Tree wiring, splicing, service and entrance wiring. How to install Lightning arresters. Transformers with diagrams and instructions.

INSIDE WIRING—When and where to use rubber covered, slow burning and weatherproof wire. How to find the proper size of wire to use for lamps, motors or heating devices for any current, voltage and drop, either by formula or by the many tables that are given in this section of the book. How to wire for two-wire or three-wire systems. Direct current, two-phase and three-phase with formulae and tables, with examples worked out for each system and in a simple manner that anyone can understand and use. How to run wires on walls, ceilings, floors, through partitions and walls and in concealed places, damp places and where dangerous surroundings exist. When and where to install Switches, Cut-outs and Circuit Breakers and just how to do it. How to wire for high and low voltage systems and the precautions to be taken. The proper way to install Knife and Snap Switches, Cabinets and Cut-out Boxes, Outlet, Junction and Switch Boxes, Panel Boards, Wooden and Metal Raceways. How to install complete interior conduit jobs either for rigid metal, flexible metal or flexible non-metallic conduit. Concealed knob and tube work or armored cable. How and where to install and wire electric and combination lighting fixtures. How and where to use flexible cord and where not to use it. How to install arc lamps and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and gas filled lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination and where each should be used. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

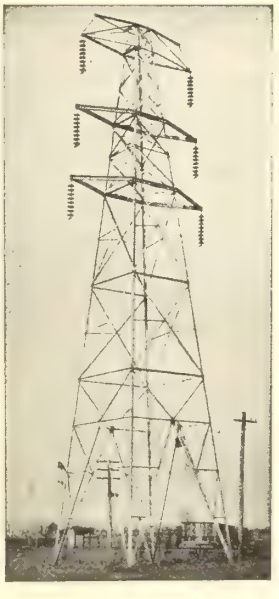
The Ford Motor Company Uses—

Spaulding HARD FIBRE

The Ford Company uses Spaulding Hard Fibre for the purposes illustrated above because of its great mechanical strength; its electro rupture of 200 to 400 volts per 1-1000th of an inch of thickness (an insulator that will not break nor crack), and because of its adaptability, as it can be machined, sawed, punched, etc.



WRITE FOR ILLUSTRATED LITERATURE explaining how you can save money and get better results by using Spaulding Hard Fibre in your product.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price $3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price $2.00.

Alternating Currents—Examples for Students and Engineers, by Prof. F. E. Austin. Second edition, Vol. I. Published in 1916. 223 pages, illustrated. Price $2.40.

Applied Electricity for Practical Men, by Arthur J. Rowland. Published in 1916 by McGraw-Hill Book Company. 375 pages, illustrated. Price $2.00.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price $1.00.

Central Station Management, by H. C. Cushing, Jr., and Newton Harrison. Published in 1916 by D. Van Nostrand Company. 397 pages. Price $2.00.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price $3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price $2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price $1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price $2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price $2.00.

Electric Cooking, Heating and Cleaning, by Maud Lancaster. Published in 1914 by D. Van Nostrand Company. 330 pages, illustrated. Price $1.50.

"Electrical Machinery"—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price $2.00.

"Electrical Meters," by Cyril M. Jansky, B.S., B.A. Second edition just published by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price $3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electrical Instruments in Theory and Practice, by Murdoch and Oschwald. Published in 1915 by Whittaker & Company, 366 pages, illustrated. Price $2.50.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

'Electrical Measurements in Practice," by F. Malcolm Farmer. First edition. Just published by McGraw-Hill Book Company. 359 pages, illustrated. Price $4.00.

Electrical Measurements, by O. J. Bushnell and A. G. Turnbull. Published in 1914 by American Technical Society. 164 pages, illustrated. Price $1.00.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

"Hydro Electric Power Stations," by Eric A. Lof and David B. Rushmore. First edition. Just published by John Wiley & Sons. 822 pages, illustrated. Price $6.00.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Practical Mathematics for the Engineer and Electrician, by Elmer E. Burns and Joseph G. Branch. Second edition. Published by the Joseph G. Branch Publishing Company in 1914. 143 pages, illustrated. Price $1.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

"Public Utility Rates." A discussion of the Principles and Practice underlying charges for Water, Gas, Electricity, Communication and Transportation Services, by Harry Barker, B.S. First edition, just published by the McGraw-Hill Book Company. 387 pages. Price $4.00.

Pumps and Pumping, by M. Powis Bale. Published in 1912 by Crosby, Lockwood & Son. 120 pages. Price $1.50.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price $1.75.

Radio-Telegraphist's Guide and Log-Book, by W. H. Marchant. Published in 1912 by Whittaker & Company. Illustrated. Price 75 cents.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Railway Maintenance Engineering, by Wm. H. Sellew. Published in 1915, by D. Van Nostrand Co. 360 pages, 194 illustrations and 6 folding plates. Price $2.50.

Standard Wiring, 1917 Edition, 23rd Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.00 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price $1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price $4.00.

"The Lighting Art," Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price $2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price $4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Tramway Track Construction and Maintenance, by R. Bickerstaffe Holt. Published in 1915 by The Tramway and Railway World. 249 pages, illustrated. Price $3.00.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price $1.00

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price $1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price $1.50.

ELECTRICAL NEWS, 347 Adelaide St. W., Toronto, Ontario

Teaching Your Customers

THE logical place and time to talk to your customers is in the Electrical News when they are thinking of things electrical.

If your product is bought by electrical men, advertising in the Electrical News will carry your message to them.

You and your wares may be favorably and nationally known to-day but if you don't advertise you will soon be forgotten.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que.; Ottawa, Ont.; Quebec, Que.; St. John, N.B.; Toronto, Ont.; Vancouver, B.C.; Victoria, B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.

TRADE DAUM MARK **Renewable Fuses**

FOR ELECTRIC LIGHT AND POWER

Always were the simplest fuses in construction on the market. The new Type "B," Form 4, has been reduced to the fewest parts—four metal parts of solid brass, a fibre shell and the fuse strip. Caps are removed by a twist of the wrist and as easily tightened, holding the fuse strip in intimate metal-to-metal contact.

Oxy-Acetylene Welding

Speeds up Production - Conserves Material

Automobile Crank Shaft successfully reclaimed by Welding

Whenever a problem arises involving the joining of metals (whether for manufacturing purposes or repairing broken equipment) Oxy-Acetylene Welding is almost invariably the solution.

No plant, however well equipped otherwise, is complete without an Oxy-Acetylene Welding Outfit to take care of the everyday repair jobs that a speeding up of production entails; and is absolutely imperative in order to completely avoid the disastrous consequences that must inevitably follow a serious breakdown, and the inability to obtain replacements.

We shall be pleased to give you all particulars as to the benefits to be derived from the Process in your Industry, without obligation, and your interest will be appreciated.

Westinghouse

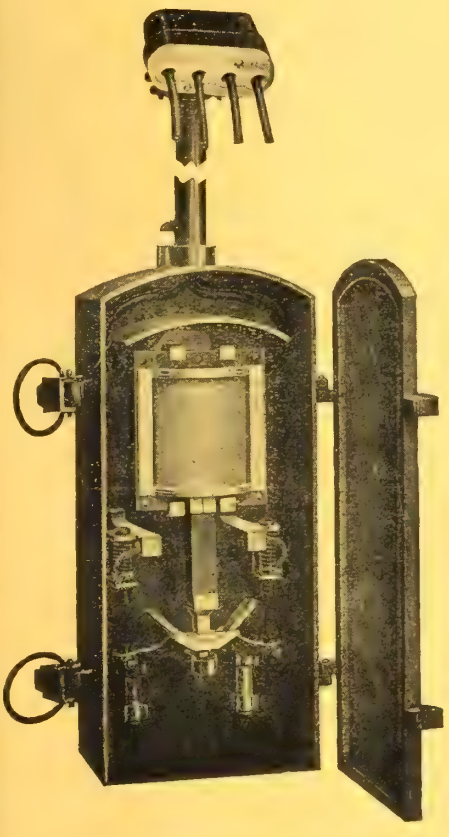
Electric Irons with Attached Stand

Practically indestructible, few parts, no delicate pieces, efficient, long life, monoplane heating element.

Radiation from top prevented by dead air space, all heat given off at ironing surface.

A heat storage pla te stores the heat not being taken by the ironing surface making the iron stay hot longer.

The weight, 6¾ lbs., makes heavy ironing easy, but is balanced so nicely that the finest lingerie is ironed with ease.



The handle fits the hand, and is so sloped that it takes the strain off the wrist.

The attached stand enables you to turn the iron upside down and use it as a hot plate.

This is the Most Satisfactory Iron to Handle.

SOLENOID SWITCHES

Essential for Modern Street Lighting Methods

This cut shows our Type 17 H.E.P. Solenoid switch which was

ADOPTED BY HYDRO ELECTRIC COMMISSION

of the Province of Ontario and used by them in a large number of Ontario towns.

Orders are received from all the Provinces.

This switch is no experiment. The fact that it has been adopted by the Hydro-Electric is proof of its success.

No springs, switch or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

Write for complete descriptive particulars.

O-B PRODUCTS

Saving the "Overhead"

On the Line

A "wild" pole can do a great deal of damage to overhead construction. This danger is minimized, however, if the cars are equipped with O-B Catchers or O-B Retrievers.

The Catcher is for city service. It catches the pole when it leaves the wire and holds it safely. It keeps the rope reeled in and prevents it from dangling dangerously.

The Retriever is for high-speed service. It catches the pole when it jumps and then pulls it clear down out of harm's way—even though the car coasts under several spans.

In the Shop

O-B Catchers and Retrievers are unfamiliar visitors in the repair shop. Maintenance charges against them are practically nil.

Every part has been made strong and rugged. The mechanism is very simple. This combination of ruggedness and simplicity keeps them on the cars, doing their duty day after day.

Plenty of rope-room is provided, so the trolley rope cannot foul in wet or snowy weather.

Send for a detailed description of their design and operation.

Ask about a trial on your own cars

The Ohio Brass Company

MANSFIELD, OHIO

LINCOLN MOTORS

Arc Welding is More than a "Patching" Process

Welding has been so widely featured for repair and patching work that many people never think of it as a manufacturing process.

As a matter of fact Lincoln Arc Welders used in manufacture of metal products are frequently making even greater savings than in repair work.

Lincoln Arc Welders

are especially adapted to fabricating iron, steel, and other metals—welding seams, fastening on attachments — joining of parts—in fact, any work of this nature on which speed and economy count. The heat from the Lincoln Arc can be concentrated on a small surface, giving a clean looking job and preventing the warping or buckling usually encountered in gas welding.

The operation of the Lincoln Welder can be learned by any intelligent workman in two or three days. Once broken in he can do welding jobs at lower cost than with any other equipment or process. This we prove in any shop.

Our Welding Engineer will gladly inspect a plant and product for welding possibilities—at no cost to the owner.

Greater Protection

in the Special C & H Poly-Phase Meter

For Installation on Long Distance Transmission Lines

Up-to-date in every respect the great outstanding feature of this new meter is safety. This is secured by the use of a new double terminal block which obviates accident caused by surge conditions during lightning storms. The Poly-Phase Meter has also more interior space for making connections, and the three line wires are carried direct through the meter.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Time, Labor and Material

UNIVERSAL INSULATOR SUPPORTS are specially designed malleable iron clamps made in four sizes for securing Insulators to open steel framework for wiring mills, foundries, shops, bridges, piers, elevated railways, subways, train sheds—and similar structures. They are easily attached, and by their use, electric wiring for lights, motors, generators, cranes, etc., can be installed with a great saving of labor and material.

Demonstrate the Branston Violet Ray Generator in your store

During the two weeks of special selling—APRIL 8th to APRIL 20th—our tremendous advertising campaign will create a bigger demand than ever for Branston Violet Ray Generators all over the Dominion. Thousands of Generators are now being sold, and every one is an advertisement in itself. We realize this fact, and have proven that special demonstrations arouse a great deal of interest—lead to many sales—make satisfied customers—**increase your profits.**

In March and April, with the breaking up of winter, come slushy streets and muddy roads, cold, raw winds. It's the time of colds, coughs, neuralgia, rheumatism, neuritis, headache, earache, and backache—the time when every ache and pain in your town means a prospective purchaser of a Branston Violet Ray Generator, the most wonderful scientific discovery of modern times for the relief of pain and the cure of diseases. Used, endorsed, and recommended by the most prominent Physicians, Hospitals, and Sanitariums throughout the country.

Violet Ray

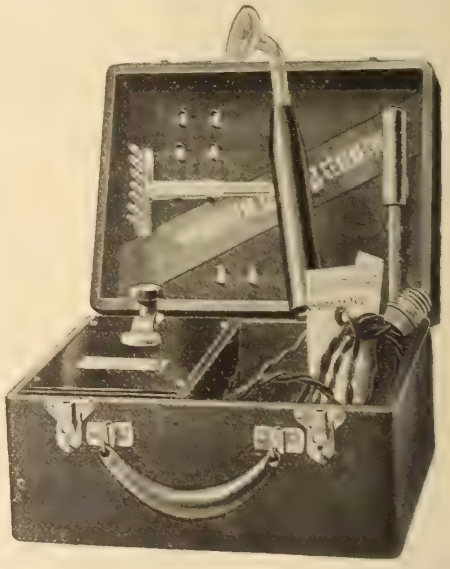
CAMPAIGN WEEKS April 8th to April 20th

If you are not a Branston Violet Ray dealer write us to-day and get in on this.

We are running full-page advertisements in the leading magazines, calling attention to the Branston Violet Ray demonstration in your store. We are preparing attractive complete window trims, display cards and streamers, lantern slides for the movies, catalogues and special folders, advertising electrotypes for your local newspaper. Every medium that will assure profitable results to dealers is being utilized.

Reap the full benefit and co-operate with us during this campaign. Put in a good window of Branston Violet Ray Generators. Use the window trims we supply you.

Special Reduced Prices for this demonstration.



Remember the dates—Branston Violet Ray Weeks, April 8th to April 20th.

Write to-day for complete information.

SPECIAL REDUCTION

This $40.00 Generator special retail price $34.50

The Model 7 Branston Violet Ray High Frequency Generator regularly sells for $40.00. But during this introductory campaign only the retail price has been reduced to $34.50.

This machine is designed for general all-round family use, for which it will be found eminently practical. It is put up in an attractive and durable leather-covered, velvet-lined case, 12 x 9 x 6½ inches, complete with connecting cords, one No. 1 surface electrode, No. 2 metal electrode and No. 4 Comb electrode.

Vol. 27 Toronto, March 15, 1918 No. 6

Hydro-Electric Development Should Be Pushed Forward

Whatever expenditures may or may not be justified at the present time there seems to be no question either in the minds of the electors or of the members of the local legislature that the Hydro water-power development work must go forward. This is evidenced by the amount of something over nine million dollars which appears in the Ontario estimates for the coming year.

Though this, at first thought, may seem a too heavy expense under present conditions, it is well to consider that, in view of the fuel situation, it is an emergency necessity. Nor is it entirely impossible to figure it out as a good investment. Let us suppose that every two hundred dollars expended by the Commission in construction work delivers one continuous horsepower for one year; the total sum is equivalent of 45,000 h.p. years, the value of which varies depending upon the use to which it is put. On the basis of B.t.u's it is the equivalent of about 37,000 tons of anthracite coal, which, at ten dollars a ton, is worth $370,000, and represents a return of slightly over four per cent. If the developed water-power were used for heating purposes this would probably represent somewhere near its value.

Going to the other extreme, however, it is frequently stated that at the efficiency of the steam railway engine it requires seven pounds of coal to produce one kilowatt hour. On this basis the 45,000 h.p. years is the equivalent of approximately one million tons of coal with a value of, say, $10,000,000. Of course, before this power can be utilized on the railways there must be an expenditure of many millions in equipment. The fact remains, however, that, cheap or expensive, water power is, up to a certain point, a substitute for coal, and since our coal supply is threatened it would be unwise to neglect to develop the water falls. The same argument applies to the St. Lawrence and numerous other powers. When people are freezing to death they are not apt to haggle over the price of heat.

Needless Waste of Fuel Hinders Conservation

Following a paper by Mr. John Blizzard, B.S.Sc., on the subject, "Availability of Energy for Heat and Power," presented before the Ottawa branch of the Canadian Society of Civil Engineers; Mr. Edgar Stansfield, M.Sc., chief engineering chemist of the Mines Branch of the Department of Mines, submitted a number of recommendations. Mr. Blizzard's remarks and recommendations have particular reference to the unnecessary waste of fuel due to waste of by-products and the inefficient operation of steam railways and power-generating plants. These recommendations are as follows:

Fuel Recommendations

That a Dominion board of energy commissioners be established, somewhat on the lines of the Board of Railway Commissioners, and that this board be given wide powers.

That the board consist of mechanical engineers, electrical engineers, and chemists, the best men available in their respective spheres, having not only high scientific and technical ability but imaginatoin.

That the board be given investigative, advisory, and restrictive powers:

Investigative power to carry out such laboratory and large scale investigations as are necessary for the efficient utilization of our resources; the scope of the investigations to include the winning and marketing of fuels and their by-products, as well as the development and employment of power and heat.

Advisory power to furnish the best advice and most up-to-date information, including recommendations as to new developments, improvements of old plants, consolidation of power plants, and the co-operative establishment of allied industries.

Restrictive power to prohibit the inception of needlessly wasteful schemes, and to compel the improvement within a term of years, where such improvement can be shown to be commercially practicable, of all established, needlessly wasteful, processes.

Extracts from Mr. Blizzard's paper are also reproduced elsewhere in this issue. The recommendations are being submitted to the council of the C. S. C. E. at Montreal.

Interesting Talks Before Montreal Electric Club

One of the brightest talks of the season was given by Mr. M. P. Fennell, secretary-treasurer of the Montreal Harbour Commissioners, at the Montreal Electrical luncheon on March 6. The subject, "Canadian Ports and their Relation to Transportation," does not sound particularly lively, but Mr. Fennell made it of more than usual interest, and narrated many facts in a manner that compelled attention. The speaker has visited all the great ports of the world, and was thus able to speak with first hand knowledge of his subject. He first alluded to the fact that it was intended in the near future to entirely electrify the harbour of Montreal. After defining a port and a harbour, he pointed out that three factors largely determined a harbour—the potentiality of the tributary commerce, size and accessibility, and the develop-

docks. In Canada the interior tributary trade from the northwest, and Mr. Fennel briefly reviewed the process of the transportation of grain from those districts to the seaports. There were three main routes, Hudson Bay route being developed by the government; the Great Lakes, connected with Gulf and River St. Lawrence; and the Panama Canal. To show the immense growth of the facilities for handling this traffic, Mr. Fennell mentioned that the elevators had grown from 500, with a capacity of 18,000,000 bushels, in 1900, to over 3,500, with a capacity of 200,000,000 bushels in 1917.

The speaker alluded to the competition with United States ports for this trade, and remarked that the St. Lawrence route had decided advantages over the Erie Canal route, in the way of shorter canal voyages and depth of water. Still, the United States had been able to retain a large share of the trade, owing to the use of larger vessels and by improving the railways between Buffalo and New York. He asserted that Canada had the most efficient and most economical waterway on the north American continent, and stated that 65 per cent. of the water-borne commerce of Canada came by way of Montreal.

Mr. Fennell briefly described the natural difficulties which had been overcome in building up the ports of Glasgow, Newcastle, and Manchester, at a very heavy cost, and yet, he said, Montreal did as large a trade, on a monthly basis, as these ports, at a total outlay of $27,000,000. The system in Montreal was on a pure business basis, without any political considerations, and without any of the disadvantages, from the point of view of granting monopolies to big corporations, which obtained at so many of the United States ports. The American ports were now copying many of the features of the Montreal system. Montreal was being systematically developed with a view to obtaining the supremacy in the contest in which the United States and Canadian ports were engaged for the trade of the northwest.

Brig. Gen. A. E. Labelle, one of the Harbour Commissioners, made a short speech.

Electro-culture at Chester, England

An interesting report on electroculture experiments, carried out during the past summer, has just been presented to his corporation by Mr. S. E. Britton, city electrical engineer of Chester, Eng., and is published in various British magazines. The land, comprising 1.4 acres of pasture, was plowed and trenched shortly after Easter and arranged in three plots of approximately: A, 970 square yards; B, 4,000 square yards; C, 1,800 square yards. The largest plot was equipped for electroculture, and lies between the two smaller plots.

For comparison three varieties of potatoes were planted, and the following result was obtained:

Plot A, natural control—Number of roots: Great Scot, 413; King Edward, 315; Summit, 359. Average yield per root: Great Scot, 1.363 lb.; King Edward, .485 lb.; Summit, 1.344 lb.

Plot C, natural control—Number of roots: King Edward, 238; Summit, 398. Average yield per root: King Edward, .567 lb.; Summit, 1.497 lb.

Plot B, electroculture—Number of roots: Great Scot, 2,294; King Edward, 480; Summit, 7,294. Average yield per root: Great Scot, 1.684 lb. (23.5 per cent. increase); King Edward, 1.231 lb. (153 and 117 per cent. increase); Summit, 1.451 lb. (7.5 increase; 3.1 per cent. decrease).

With regard to the Summits grown on Plot C, it should be noted that the supply wire from the shed to the discharge wire was passed over this ground, at a height of 8 ft.

Other vegetables were grown, but, owing to late planting, ttempt was made to obtain comparative result. Peas, eans, white turnips, swedes, and beet did well; carrots and onions were very poor, both in quality and quantity. Greens did well, and it was noticeable that those under electroculture were not attacked by caterpillar to the same extent as those under natural control. No manure or fertilizer was used.

The electrical equipment consisted of a 10 in. coil, with mercury break-current interrupter and Lodge valves, housed in a wooden shed, 25 yards from the plot, and an earth plate close to the plot. No. 30 s.w.g. galvanized steel wires were used for the discharge, placed 15 ft. apart and hooked to 7/16

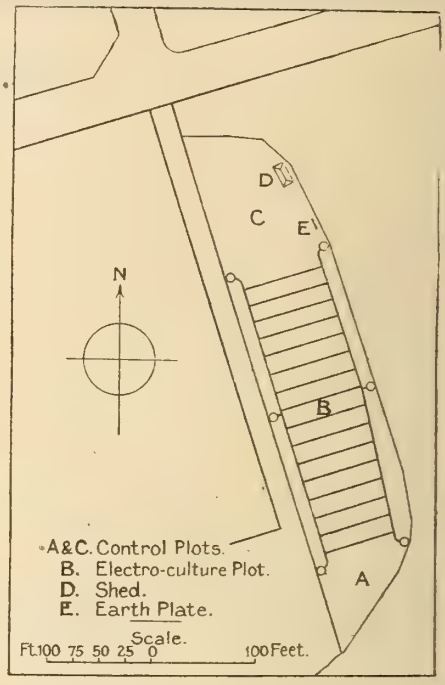

Fig. 1—Plan of Ground Used

in. s.w.g. span wire attached to insulators; and the whole supported by six poles. To each of the poles was fixed a wrought-iron bar, which enabled the discharge wire to be placed at any distance from the ground between 2 ft. 6 in and 6 ft. 6 in. The apparatus was supplied with 5 amperes at 210 volts d.c., which would maintain a spark ¾ in. long. when an earth wire was placed that distance from any part of the discharge network.

At the commencement the discharge wire was placed as near as possible to the ground, and, as the crop grew, raised

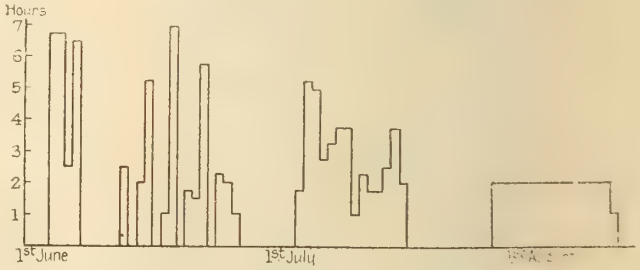

Fig. 2—Diagram showing hours per day discharge used

to about 6 in. above the foliage. When climate and other conditions allowed, the discharge was used from 6 a.m. to 8 a.m. and 6 p.m. to 8 p.m. daily, and during dull days between midday and 2 p.m. In all the discharge was used for 122 hours, during which time 128 units were used. The direction of the wind was from the south 16 per cent., southeast 23 per cent., southwest 42 per cent., and west 19 per cent.

This experiment indicates that it is not detrimental to place the discharge wire near to the plant, and that for experimental purposes and to obtain comparative results it is not necessary to have the control plot several hundred yards distant from the plot under electrical treatment, as is the case

when the discharge wire is placed 10 to 15 ft. above the crop.

Mr. Britton concludes that although the subject is a complex one, and at the present rate of progress will take years to develop, the possibilities appear to be tremendous, and when it is better understood astounding results may be expected. It should, however, be made perfectly clear that its present state of development does not warrant its general application, and that there is yet to be evolved a more settled conception of the botanical effects and electrical requirements on which to base the practical work; therefore, at the present time results should be treated as experimental. Probably the most useful progress would be made by encouraging electric supply undertakings in conjunction with plant physiologists to systematically experiment on small plots.

Develop Our Water Powers and Be Independent of Coal

But the world must be very largely rebuilt, and development must be along scientific lines, which have not been followed heretofore. That brings we down to what I really want to impress upon the gentlemen present—not that I expect to give you a speech on this subject, for I realize that I do not know nearly as much about it as you do—and to impress upon every man and woman in this country, and that is the need of building up of this and every other civilized country when this great struggle is over. There are so many things around us waiting to be done, and they can only be done on proper lines, and that means on proper engineering lines. As far back as I can remember, the idea seems to have been that when a young man went into the engineering profession about the only work for him to do was on the railway survey. You see, that is all that we realized the engineer was for. And when he got through with one job he looked for another. I presume that is the experience of many men—and I see here to-day gentlemen of my acquaintance whose heads are getting as bald as my own, who have had great experience in the railway service, and I think they realize that, especially in the rural parts of our section of the country, that has been the idea of the field of usefulness for the engineer. But when the war is over we shall find that too narrow an application of engineering skill. Of course, we must have railways. I do not want to discuss the railway situation of Canada to-day, but I may go so far as to say that we are pretty well supplied with railways—at least, the Government of Canada is. Without discussing the construction of more railway, I realize that the government railways must be reconstructed. They must be safe for the trains that run over them. And this work of rebuilding is going to call for engineering ability and service. But when we have considered the railway needs we have only commenced to discuss the real engineering problems which Canada has to face. I should say that the first problem we have to face is the development of our water-powers. I may be considered a crank on this subject, but it seems to me that the experience of this country in the past three or four months because of the lack of coal must set every man thinking, even though he be the most ordinary layman in these matters, on the necessity of developing our water-powers so as to make ourselves independent of coal as far as possible, at least for power. I do not say the same applies to heat. We were having a very interesting discussion at this table during luncheon on this point. I do not believe that we have yet reached the stage of development where we can economically heat our buildings with electricity. But if all the power we use were developed electrically we could save an enormous amount of coal, sufficient to heat all our buildings. But there are applications of heat in which electricity can be used, especially in cooking. I was surprised to have your president tell me that under the ruling prices of to-day the cost of cooking for an ordinary family is $2 a month. That is away below the cost of cooking with coal. This illustrates how water-power can be used, not only for power but for heat, and in a hundred and one things necessary in the world to-day. When I look around the city of Ottawa, which really exists on account of the development of your water-power, and realize that probably not one-quarter of the available water-power within twenty miles of the city is yet developed, I sometimes wonder what could be accomplished if we had sufficient money and energy to have all these water-powers developed. I never drive up the Gatineau without thinking of the great water-powers there that are going to waste. And up the Ottawa there is the same condition. And when you come to the St. Lawrence River you have power going to waste by the million horse-power. I am not advocating any policy—I do not think it would be wise to do so, occupying the position I do—but if I might be permitted an expression of personal preference, to me there is a great deal more beauty in water-power developed and working than in water-power going over a rapid. I quite admit that I have not been trained along the aesthetic lines on which some of my neighbors have been led, and so may not sufficiently appreciate the beauties of nature. But I do appreciate the beauty of water going through a water-wheel. And I quite understand, also, that this desire cannot be brought about except by co-ordination of the training of the engineer and the capital of the man who is willing to risk money to make more money. I am not talking questions of policy, but I hope that I shall live to see the time when there will not be one rapid on the St. Lawrence, but all will be converted into water-power and making money. And what I say of the rapids of the St. Lawrence I say with regards to every waterfall on every river in the Dominion.

* Extract of an address by Hon. F. B. Carvell, before Ottawa Branch C. S. C. E.

Hydro Expenditures

Some nine million dollars have been placed in the estimates to be expended by the Hydro-electric Power Commission of Ontario in developments and extensions. This work is to be apportioned as follows:—

Chippewa Power Development	$4,175,000
Niagara System Extensions	2,856,268
Central Ontario System Extensions	588,185
Nipissing System Extensions	60,000
Severn System Extensions	405,212
Eugenia System Extensions	233,541
Wasdell's System Extensions	1,000
Port Arthur System Extensions	150,000
St. Lawrence System Extensions	251,000
Muskoka System Extensions	6,800
Rideau System Extensions	117,945
Service Building and Miscellaneous	100,000
Expenditure on Account of Province	110,000

The Edmonton Electric Light and Power Department made a surplus for the month of January, 1918, after paying all charges, of $19,376.18. The revenue for January constitutes a record for any month in the history of the department, as did also the number of consumers connected. The Canadian Northern Railway Company's shops have installed an additional 120 kv.a. synchronous motor on city service, to be used for driving an air compressor, and the Western Canada Flour Mills have installed a 75 h.p., 2,300 volt motor at their local mill.

The Department of Trade and Commerce of Canada reports that there is a large demand for electrical equipment and accessories in Australia. A range of samples and all particulars are on file at Ottawa.

Electric Drive in a Canadian Cement Mill

A Severe Test for Motors Owing to Dust Conditions—Only Few Minutes Rest Once a Week—A 14,000 H. P. Installation

Electric motor drive in a cement mill constitutes one of the most severe forms of service, owing largely to the unavoidable prevalence of dust, and requires careful and continual inspection. The plant of the Canada Cement Company at Longue Pointe, near Montreal, operates 24 hours a day, and 7 days a week. When running to its full capacity, the motors driving the grinding mills will probably be shut down for a few minutes only once a week and for longer periods for repair to the mill probably once in six months, which means that the motors are practically running continuously for six months. In the case of elevators and conveyors, these are seldom shut down except to change motor bearings or to replace conveyor belts or screws. It is very important that these conveyors and elevators be kept running continuously, as generally a shut down of one of these means a shut down of a whole department, whereas the shut down of an individual grinding mill is not of such importance. But the service is entirely satisfactory, owing chiefly to the efficient inspection maintained by the electrical engineer, Mr. F. C. E. Burnett.

The equipment at this plant includes roughly 14,000 h.p. of Canadian General Electric motors, ranging in size from 10 h.p. at 1200 r.p.m. up to 250 h.p. at 600 r.p.m. The motors are, almost without exception, of the squirrel cage type, and are belted to their drives. The only exceptions to this rule are motors operating winches in the quarry, motors direct coupled to pumps for water supply, and the motors operating a coal handling bridge, these being d.c. motors, running on 600 volts. Power is received at 10,000 volts, three phase, and transformed to 600 volts in the sub-station. The sub-

Fig. 1—Part of installation of 16 100-h.p. motors driving pulverizers

station equipment consists of six 2000 kv.a., 60 cycle, 3 phase water cooled C. G. E. transformers. The maximum load on the sub-station has so far been about 10,000 kw. A purely induction motor load of this character would result in a low power factor, and, therefore, to supply the necessary magnetizing current to correct this there are installed two 2,000 kv.a. C. G. E. synchronous condensers operating at 600 volts. The station contains the usual equipment of lightning arresters on high and low tension sides, and high tension switches controlling the incoming lines with low tension switch gear controlling some 18 feeders on the low tension side.

In line with modern practice all drives are by individual motors, and this results in a remarkably good load factor being obtained. The load factor each month runs over 80 per cent., a condition which is hardly possible unless individual drives are employed. The motors are all controlled by N.R. compensators and all those of 35 h.p. and over are

Fig. 2—Group of 35-h.p., 600 r.p.m. motors driving kilns

equipped with over-load trip coils operating through the no-voltage release on the compensator.

While there is nothing specially worthy of note in the actual drives, the conditions under which the motors operate are well worthy of attention. A cement mill is one of the hardest of all plants on its motive power, owing to large quantities of a dust that is very hard, fine and penetrating. As will be seen from the photographs, the bearings have all special provision for keeping out the dust, but in spite of all precautions that can be taken the dust certainly does find its way into the bearings and causes heavy wear. Notwithstanding this the larger motors are often run for twelve months without having the bearings rebabitted, but the smaller motors require it more frequently. To aggravate the effect of the dust on the bearings tight belts have to be employed throughout as the dust causes a considerable amount of slipping between the belt and the pulley unless run much tighter than would be considered necessary under ordinary conditions. It is interesting to note here that most of the pulleys are cast iron pulleys, it having been found impossible to make use of the good qualities of paper pulleys owing to the dust cutting them so quickly.

Although the motors are all squirrel cage, they have, without exception, to start up against a heavy torque. In the case of tube mills and ball mills the starting torque actually exceeds the full load running torque by as much as 25 per cent. In spite of this fact no trouble has been experienced in starting up this load with the squirrel cage motor. An installation of motors working under such conditions can give satisfaction only if a rigid system of inspection is adopted. When the inspection system is faithfully carried out such an installation operates with remarkably little trouble. The Inspection Department's duties, while covering the entire electrical equipment of lighting and power,

is more particularly concerned with the air gaps of the motors. These are checked regularly by means of the gauges supplied with the motors, and a bearing is never allowed to go so far that the rotor rubs on the stator. Before the bearings reach the danger point they are changed. Another minor matter which might be of interest to those operating motors under similar conditions, is the question of dust collecting around the bearings themselves. If left undisturbed, the dust by capillary attraction soon removes the oil from the oil wells, therefore, the inspection department is charged with the duty of cleaning the bearing housings at regular intervals.

Figure 1 shows part of an installation of 100 h.p. motors at 600 r.p.m., driving pulverizers, which are used to grind the raw mixture to a fine powder before it is burned in the kilns. There are 16 of these pulverizers with 16 motors mounted in two banks of eight each. In this case it will be seen that the motors have protecting hoods mounted over them to prevent dust accumulating.

Figure 2 gives a view of one of the drives in the kiln room. There are 17 kilns in all, four of which are driven by one 100 h.p. motor from a line shaft, the others having individual 35 h.p. motors at 600 r.p.m., as shown in the photo.

Figure 3 shows the motors driving the kominuters, these being preliminary grinding machines for grinding the clinker. There are 15 such machines in this building set in one row, each having one 100 h.p. motor running at 600 r.p.m.

Figure 4 gives a view of the motor drives for the tube mills in the same building. There are 19 tube mills in this

Fig. 3—15 100-h.p. motors driving Kominuters

bank, each being driven by a 175 h.p. motor at 600 r.p.m. It will be noted in these two latter views that the motors are separately housed from the grinding machinery. This has resulted in much better operating conditions for the motors, and it will be noted that the protective shields are not found necessary in these cases.

A conference of the managers of the Eastern division, plant section, of the Bell Telephone Company, was held in Montreal on March 6.

Canadian Society of Civil Engineers Will Discuss Fuel and Power Situation

The Canadian Society of Civil Engineers are holding a general, professional meeting in the city of Toronto on March 26 and 27 to discuss the present fuel and power situation. The meetings will be held in the theatre lecture room of the Physics Building, University of Toronto. On Tuesday morning the delegates will visit the plant of Canadian Aeroplanes, Limited, and the plant of British Forgings, Limited. The remainder of the day and Wednesday wil' be taken up with addresses by such well-known authorities as Dr. B. F. Haanel, Chief of Fuel Division, Department of Mines, Ottawa; Mr. W. N. Neal, General Secretary of the Canadian Railway Association for National Defence; Mr. W. J. Dick, A.M.C.S.C.E., Mining Engineer of the Commission of Conservation, Ottawa; Mr. John Blizzard, A.M.C.S.C.E., Technical Engineer, Division of Fuels and Fuel Testing, Mines Branch, Department of Mines, Ottawa; Mr. E. Stanfield, Division of Fuels and Fuel Testing, Department of Mines, Ottawa; Mr. George F. Porter, M.C.S.C.E., Engineer of Construction, St. Lawrence Bridge Company, Montreal; Mr. C. A. Magrath, Fuel Controller of Canada; Mr. Albert Grigg, Deputy Minister, Department of Lands and Forests, Ontario, Toronto; Mr. E. J. Zavitz, Provincial Forester, Ontario; Mr. Arthur Hewitt, General Manager, Consumers' Gas Company, Toronto; Mr. F. G. Clark, M.C.S.C.E., Chief Engineer, Toronto Electric Light Company, Toronto; Mr. R. W. Caldwell, Chief Mechanical Engineer, Imperial Oil, Limited, Sarnia; Mr. J. B. Challies, M.C.S.C.E., Superintendent Dominion Water Power Branch, Department of the Interior, Ottawa; Mr. John Murphy, M.C.S.C.E., Chief Electrical Engineer, Department of Railways and Canals, Ottawa; Mr. J. M. Robertson, M.C.S.C.E., Director Southern Canada Power Company, Montreal, and Mr. P. H. Mitchell, A.M.C.S.C.E., Consulting Engineer, Toronto.

Electric Power Used to Drive Field Machinery

For House and Barn the Application of Electricity is an Accomplished Fact—Sowing and Reaping Come Next

Some practical experiments on the use of electric power in field work on the farm are described in the General Electric Review by J. H. Davidson and F. E. Boyd.. The application of electricity to the farm has become an accomplished fact around the buildings for both light and power purposes, but so far the difficulty of transmitting electric power to the more remote points on the farm has constituted an insuperable difficulty to its use in ordinary cultivation operations. The present paper describes how these obstacles were successfully overcome, and gives a number of very interesting results on the probable cost and consumption of the apparatus. The following is extracted from the paper in question:

In order to secure some definite data concerning the possibilities of electric power for field work the authors conducted an experiment which involved the following distinct features:

Design and construction of an experimental electric tractor.

Practical field test of tractor.

Tests to determine power consumption.

Analysis of results and conclusions.

The experiment was confined to the use of power obtained direct from a commercial transmission line, and storage batteries were not considered.

The tractor was designed for truck crop work. Two drivers were used with a cultivator as an integral part. It was designed to travel 140 feet per minute, and was driven by a 3 h.p., 220-volt, 3-phase motor. The machine was made by utilizing parts of other machines as far as possible. The drivers were 32 in. in diameter, with a 4 in. face. Three speed reductions were required, which were effectd by a belt, a bevel gear set, and a spur gear set. The machine carried a cable reel, and through the operation of a friction clutch the cable could be played out or wound up as desired. In operation the cable was dropped at the side of the tractor when travelling away from the main power line and picked up on the return. It was necessary to shift the cable connection at the end of the field occasionally by moving the plug connector to a new receptacle. The experimental machine, complete with 180 feet of cable and cultivating attachments, weighs 735 pounds.

Conservative estimates made in collaboration with the power company engineers indicate that the poles and line material necessary for the installation, even at the present high prices, will not exceed $110. The estimated price of the machine is $500; thus, for $610 the equipment could be put on a farm ready to operate. These figures make liberal allowances for manufacturing and merchandising, and for the electrical man on the installation.

Although it is a fact that the equipment has limits on its radius of operation as compared with a horse (which, together with harness, would cost in the average of $275), it should not be overlooked that the machine is capable of doing many things that a horse cannot do. For instance, it constitutes a portable motor which can readily and easily be moved about the farm by one person to be belted to a woodsaw, churn, pump, feed grinder, cider mill, grindstone, spraying machine, etc.

An important feature of an equipment of this character is the fact that it is capable of working continuously, where a horse can work only intermittently.

Better Success Than Anticipated

After construction the experimental tractor was given a field trial. No difficulty was experienced in handling the machine, although it was not to be expected that the first machine would be free from many impractical features. However, the machine worked better than the authors anticipated. The cable was easily managed, and the fact that the machine was tethered was not so much an inconvenience as might be expected. It was unusual to find a machine working so quietly and with so much reserve power. The tractor in hard ground, where the cultivator was set deep, would slip its drivers while the motor developed an overload of 250 per cent.

Records were made of current consumption, and the following data were secured:

Normal cultivation, current consumption, 1,867 watts.
Deep cultivation, current consumption, 2,500 watts.
Drivers slipping, current consumption, 3,200 watts.
Recultivation on soft ground, current consumption, 2,400 watts.
Cultivator on soft ground, current consumption, 2,200 watts.

A draw-bar horse-power test was made by detaching the cultivator and substituting a stone-boat for a load.

Draw bar pull, 2,285 pounds.
Time required to travel 100 feet, 46.8 seconds.
Draw bar horse-power, 0.88.
Input-electrical horse-power, 2.94.
Over all efficiency, 29.8 per cent.
Estimated output of motor, 2.48 h.p.
Efficiency of tractor, 35.5 per cent.

The efficiency of the outfit was very low. This can be attributed to the crude bearings, which were not in the best of condition.

It was noted during the tests that the slippage of the drivers while doing normal work was 2.9 per cent.; also that while reeling the cable the power consumption was less than when playing it out. This was due to the fact that the pull of the cable assisted in moving the tractor, while when unwinding there was a drag due to friction in the reel.

The following conclusions were deduced after the completion of the tests:

(a) It was demonstrated by a crude experimental machine that the soil could actually be cultivated by electric power, and that at least there were no fundamental obstacles.

(b) For garden work a light machine is desirable, keeping the power consumption low and making the machine easy to handle.

(c) The overload capacity of an electric motor is an important feature in its favor.

Comparison With the Horse

An effort has been made to compare the cost of cultivating and plowing by a horse and with this machine. It is very difficult to draw any accurate conclusions because there are so many varying and intangible factors entering into the maintenance of a horse equipment. The following approximations, although not suitable from which to draw any definite conclusions, may, nevertheless, be of some general interest:

First. Due to the greater rate at which work can be done and the continuous period over which it can be performed, it is believed that where it would take a horse about 11 hours to cultivate 8 acres (the work, of course, not being done in 11 consecutive hours), the machine could do the same acreage in possibly 8 hours (there being no question about the fact that it could be done in 8 consecutive hours). This means efficiency in the use of labor incident to operation.

Second. Although, as stated above, the cost incident to the maintenance and operation of a horse equipment is very uncertain, estimates indicate that in the cultivation of a 24-acre tract, as illustrated, there would be at least a saving of $7.50 for each cultivation in favor of electricity, plus at least a day and a half in time saved by the person operating the equipment. Opinion differs as to the number of cultivations necessary for different crops, but, of course, the more cultivations the greater the saving.

Third. It is interesting to consider what the use of this outfit will mean to the farmer with property under 40 acres, taking into account the question of how much acreage is necessary to provide pasturage and feed for horses. Any saving in this direction means a transference from the expense account to the income account.

Fourth. Expenditures for feed for the horse should not be overlooked in considering the cost of operation.

In conclusion, it is apparent from the fact that 200,000 h.p. in electric motors is now actually being used on the farm that the phrase "electricity on the farm" does not constitute an idle dream any longer. Although 160,000 h.p., of this is used for irrigation and reclamation purposes (a peculiarity to semi-arid sections), the remainder, or 40,000 h.p., is actually being used for miscellaneous farm purposes, such as were enumerated in connection with the varied uses to which the machine in question could be put on the farm. The only thing that we are not doing with electricity on any scale is plowing and cultivating, and this now bids fair to be a commercial reality in the very near future.

The Fallacy of Price-Cutting

By J. E. Bullard*

The cold weather or something else has affected my watch. Sometimes it would be fast enough so that I would have to wait several minutes before the train pulled out. At other times I would have barely time to reach the steps of the rear car before the train started. Therefore, when I heard a friend of mine say that the man up where he purchased his watch was not satisfied if there was a variation of more than ten seconds a month from absolutely correct time I decided that I would buy my next watch where he had purchased his. I was aware of the fact that the establishment from which his watch had come was rather high in price, but what was a few dollars on the purchase of an article that would last me for years, especially if the few extra dollars carried with it service that would save me many hours—in fact, enough time to more than make up any increase in the purchase price?

Last April a neighbor of mine ordered his year's supply of coal. A few months later another neighbor ordered his winter's supply, but ordered it from another dealer. The first family expected to get their coal a little cheaper than the dealer the second family ordered from would sell it. The first family has never had enough coal in the cellar to dare to build a big enough fire in the furnace to keep the whole house warm. The second family received their full order of coal within a few weeks, and have been comfortable all winter. What was a matter of 50 cents a ton compared to the worry and care of getting along from hand to mouth with the constant danger of actually suffering from the cold?

A certain church hired a certain electrical contractor to wire the building for a new lighting system. This contractor was hired because he would do the work for a low price. When the installation was completed the appearance of the church was greatly improved. There were special lights over the baptistry, for this was a Baptist church, the purpose of which was to light up this pool of water, make it safer, and make it easier for the minister to read the service. Incidentally, it also made it much easier for the congregation to see what was taking place, and, on the whole, made the baptismal services much more impressive. The first time the lights were used they worked perfectly. The next time they failed, and it was some time before the defect in the wiring that caused the failure could be discovered. These lights for several services were entirely out of commission, and the few dollars saved in the original installation were paid for at a very high rate.

It is not low prices that most people want. What they really want is the most for their money. Everybody wants service. Everyone wants real service, and every person whom it is really worth while to have as a regular customer is willing to pay for service. That concern that builds up the greatest reputation for good work and good service is going to get the most business and make the most profit. It is only the unprofitable business, as a rule, that goes to the price-cutter.

There was a time when the department stores appeared to thrive on price-cutting. Times, however, have changed. Many of the price-cutters have already gone out of the business. Others are changing their ways. Department stores are coming more and more to use something besides low prices to attract custom. Some have gone so far as never to feature comparative prices in their advertising. They do not attempt to show the public that they are selling at low prices. They rather attempt to show that they are giving good values in goods and in service for the prices charged.

A young man started a flooring business. His partner believed that they should meet their competitors on price. He, on the other hand, held fast to the idea that they should build a reputation for laying the very best floors that could be laid, and see to it that all their work lived up to this reputation. In order that he would not be handicapped in this policy he bought out his partner and ran the business himself. To-day he has the best business in his line in the city where he is located. He is busy when some of his competitors are idle, and he secures a goodly percentage of the really profitable business in his district. That is not all, however. He has been called upon to do work several hundreds of miles away from his place of business. He has been paid a bonus to supervise work near larger cities than that in which his business is located. It is the service that he renders that has brought this business to him. He has often made this statement: "If I relied upon price alone to get business I would not be able to drive my own automobile. I don't get any work on price alone. In fact, I never take the trouble to bid on any work where I know that the price is going to be the deciding factor. Most of my business comes to me from people who want really good work and are willing to pay for really good work."

Price-cutting never built good-will. There are a lot of price-cutters who are to-day bemoaning the fact that they have always secured their business by cutting prices. To-day it is not easy to cut prices. The cost of everything is increasing in price so rapidly that no business man can tell you to-day just what it is going to cost to do a certain piece of work to-morrow. Those men who have built up their buusiness through service have also built good-will, which is proving its worth to them in these days. The price-cutter of yesterday is, in fact, more than likely to be the profiteer of to-day. He is rarely, if ever, a far-sighted man. If he were he would never be either a price-cutter or a profiteer.

The church did not save very much money on its wiring job, but it lost a good deal when the lights refused to burn. It is not by any means beyond the bounds of possibility that the difference between what the collections actually were at the services when the baptismal lights did not work and what

*In National Electrical Contractor

A typical show and sales room of the Southern Canada Power Company—This one is in St. Hyacinthe

they would have been had the lights been in operating condition would have more than have paid the difference between a good job and a cut-price job. In other words, from a purely financial point of view, there is reason to believe that this church lost by having a cheap job done.

Was Getting Better Value

It may interest the reader to know that the main reason why the merchant who had his electric current bill boosted from $5 to $13 per month was so enthusiastic over this increase in cost was due to a very great extent to the fact that in the first instance he was getting only about $2 worth of service for his money, while in the second the service was saving him practically the full amount of the bill. He discovered that what he saved through increased production and in labor turnover when he used electric drive for his sewing machines amounted to as much as or more than every month the total cost of all the electricity he consumed for power purposes. Naturally, he was pleased and appreciated the service which the salesman had rendered him.

It is never very difficult to show a man of average intelligence that good service and good workmanship is worth more than a low price. Usually the difficulty lies in persuading him that you are able to give him the service and workmanship. Of course, there are some people who will always be influenced by price alone. Usually, however, these people have a very poor opinion of their own judgment. Often they do not have an average amount of intelligence. These people it is best for the ambitious contractor and dealer to leave to the mercies of his competitors who believe that the alpha and omega of salesmanship is beating everyone else on price. If this is done it will be only a matter of time until they destroy each other and business as a whole will be better for their elimination. Feature good workmanship, good material, and good service and you are bound to succeed in the end. Feature cut prices and the sheriff will get you if you don't watch out.

The death is reported of Lieut. C. R. Hillis, of Hamilton, who was wounded recently in France. Before enlisting in 1915, Lieut. Hillis was connected with the Canadian Westinghouse Company, Hamilton, as mechanical and electrical engineer. He was a graduate of Toronto University.

Code of Lighting School Buildings

The Illuminating Engineering Society of New York announces that the revised edition of its Code of Lighting School Buildings is now being placed in type. It will be remembered that the first edition of this code was circulated several months ago for the purpose of obtaining discussions and criticisms. As a result, some one hundred communications have been received from lighting experts, architects, educators, and school superintendents. These have been carefully considered by the Committee on Lighting Legislation in its revision of the technical data and principles of school lighting, which are embodied in the code.

Some 20,000,000 school children in the United States daily perform work trying to the eyes. Proper illumination is essential. Available statistics show that nearly 10 per cent of the school children who have been examined have defective vision. The exactment of rules and regulations and the dissemination of knowledge relating to correct lighting conditions is one of the most important needs of our educational institutions and legislative bodies.

While the code is intended primarily as an aid in formulating legislation relating to the lighting of school buildings, it is also intended for school authorities as a guide in individual efforts to improve lighting conditions.

The revised edition of the Code of Lighting School Buildings is being printed, and the society will be glad to sell them at cost to interested parties.

Companies Object to Using Same Poles

The question of the regulation of poles and wires of public utility companies in Montreal recently came before the Quebec Legislature. The city asked that the subject be referred to the Electrical Commission for study and the drawing up of regulations, the latter to be submitted to the Quebec Public Utilities Commission for approval and then, in turn, submitted to the legislature at the next session. It was suggested that two or three companies might use the same poles. The companies objected to the form of procedure, which also did not meet with the sanction of the legislative committee. The result of discussion on three days was that no final decision was reached.

Availability of Energy for Heat and Power

By John Blizzard, B. Sc.*

It is proposed here to outline the sources whence we in Canada receive our supplies of energy and the requirements they meet.

Coal

Coal is of first importance. In the course of a year we burn 30,000,000 tons, of which 60 per cent. comes from the United States. The remainder is mined in Canada.

Practically no coal supplies exist between the Provinces of New Brunswick and Saskatchewan, and the combined output of these two provinces amounts to only 4 per cent. of the country's production. One-half of the remaining 96 per cent. is mined in Nova Scotia and the other half is mined in the Provinces of Alberta and British Columbia. The coal reserves of Canada are enormous, and we may rely on a continuance of native supply for a very long period of years. Whether we may place equal reliance on our supply from the United States or not is uncertain. The present shortage seems to be due to abnormal difficulties of transportation rather than those of production. It is certain, however, that the supply of anthracite from that country will decrease, and that the time is not far distant when they will come to us for their supply of coke or coking coals.

A part of the annual coal consumption is accounted for as follows:

	Tons.
Manufacture of coke	2,000,000
Railway locomotives	9,000,000
Collieries	1,000,000
Bunkering ships	1,000,000

The remaining 17,000,000 tons are used for domestic and general manufacturing purposes. An approximate estimate of its subdivision is: Five million tons for domestic heating, six million for industrial heating, and six million for industrial power.

Assuming that the colliery consumption is for power purposes only. and that 7 pounds of coal generates a horse-power hour, the total mean continuous applied horse-power in Canada derived from coal is 500,000, of which locomotives develop 300,000.

Water-Power

Water-power is used for the most part to supply mechanical and electrical energy. About 2,000,000 horse-power has, so far, been developed The total available horse-power is estimated at about 18,000.000, of which 8,000,000 is estimated to be available within the present range of markets. An additional development of 6,000,000 horse-power, assuming an efficiency of conversion of 60 per cent. and a plant factor of 40 per cent. would supply about 1,500,000 horse-power continuously. This is much more than sufficient to supply that generated yearly by our 16,000,000 tons of coal.

Wood

Wood is a very important Canadian fuel. The estimated value of firewood used during 1916 was $62,000,000, or more than the value of our coal imports. Although to some extent, its use may be for power generation, principally in log-product factories, it is probable that most of it is used for domestic purposes. It is not likely that it will, to any extent, be able to take the place of other forms of energy, except spasmodically, as in times of an acute scarcity; nor is it likely that other forms of energy will take its place.

Oil and natural gas occupy an inconspicuous position compared with wood, coal, and water-power. The annual oil consumption is about 250,000,000 gallons, and practically all of it is imported. It is in a more available form for the generation of power and heat than any other fuel. While not impossible to replace it with other forms of energy for small gasoline and kerosene engines, such a change could be effected only with great inconvenience. In addition to its use for these purposes, crude oil in large quantities is used, particularly in the West, for railways, ships, and industries. Altogether, at least 100,000,000 gallons are burned under steam boilers.

Mr. Van H. Manning, director of the United States Bureau of Mines, in reviewing the oil situation of that country, estimates that its supply at the present rate of usage will last only 25 years. He further remarks that petroleum should be used neither for gas manufacture nor for fuel under boilers, nor in any way to compete with coal. It would appear, then, that we must soon find another source of supply. This may come from the known shale deposits of Canada or the United States or, possibly, from the vast unexplored areas in the west of Canada. The distillation of oil shales would not be a new venture, since, in Scotland, 3,000,000 tons are produced annually, giving about 20 gallons of oil to the ton. Another source f oil is tar obtained from the distillation of coal and lignite. Benzol, another coal-distillation product. is an excellent motor spirit, though to counteract its tendency to freeze at only fairly low temperatures it is necessary to mix it with alcohol or gasoline. Still another coal by-product, napthalene, may be used for explosion motors.

There is no doubt that alcohol is destined eventually to become prominent as a motor spirit. It is of particular importance, since it may be obtained from vegetation, and is thus independent of the stored sources of energy.

Natural gas is used in particular districts adjacent to the gas fields. Its high caloric value—nearly twice that of coal gas—renders its distribution over a large area economically possible. The annual consumption in Canada is about twenty million thousand cubic feet. It is used for industrial and domestic purposes. Since it is in a form more available for the generation of power than any solid fuel, it is advantageous to use it for this purpose whenever possible instead of coal.

Peat

Peat contributes practically nothing to our energy requirement. Yet it exists in large quantities throughout the Dominion; and, in view of its success as a fuel in other countries and the information obtained from its manufacture and use here, its availability for the generation of power and heat is known. It is impossible to believe that there is no field for its exploitation, and it must be expected soon to find a position as a source of heat and power.

This faint outline of our requirements and sources of energy does not afford information sufficient for proceeding with an enquiry which will lead to the connection of the user of power and heat with the most available form of energy. Here the possibilities of increasing the availability of our supplies of energy will be considered with reference to special methods. They will refer only to the establishment of central stations for the use of the solid fuels and to the possibility of using hydro-electric energy for house heating.

Central Station Supply

The central station may be designed to supply electrical energy, gas, steam, liquid fuel, solid fuel. and various by-products, many of which have no connection with the generation

*Extracts from paper before Ottawa Branch, C.S.C.E.

Economy. The economy of operation depends upon many factors one of the most important of which is a large system in which there is more complete utilization of the full capacity of the plant. This is due to non-coincidence of the maximum loads of the various consumers, better thermal efficiency of conversion due to the use of larger units, more complete and intelligent supervision and design, and to the possibility of operating for longer periods at the more economical rated load. The limit of the central station's sphere is reached when it is cheaper to haul the fuel to the consumer than to deliver energy through pipes or along a wire. It varies with local conditions and the type and price of the fuel. It will be greater for low-grade than high-grade raw fuel since costs of transportation vary with quantity and are independent of energy content.

The largest field for the central station will be in the generation and distribution of electrical energy. The rough estimate of the mean present power load now met by coal showed the very large requirement of locomotives. To replace the uneconomical steam locomotive with the electric locomotive seems at first sight a rational project. Where the substitution has taken place the coal consumption in the central steam electric stations is one-half of the former consumption on the locomotive. There could be no objection to its substitution for oil in forest areas and the present damage from locomotive soot and sparks would cease. An examination of the roads electrified shows that they are confined for the most part to suburban and mountain traffic. But the electrically equipped mileage is increasing, and the continuous increase in the price of coal brings the day of general electrification nearer.

The remaining power, which is used for general industrial purposes, is in itself of magnitude sufficient to warrant the consideration of central station supply. Whenever external electric supply takes the place of energy generated at the plant itself economy results. In many districts this change has resulted in reducing the coal consumption to one-quarter of its previous magnitude.

Central stations distributing gas have not so promising a field as those distributing electrical energy. The costs of transmission and the relatively high efficiency of conversion of coal into heat energy in the plant itself reduces the possible gain to the buyer. Nor is it likely that the substitution of this type of plant would save fuel. Nevertheless, the cleanliness and improved availability of gas as compared with coal would frequently lead to its preference by consumers.

Types of Central Stations

They may be of the following four types:

a. Those in which the fuel is completely gasified by partial combustion and the energy distributed either as gas or electrical power.

b. Those in which the fuel is carbonized and energy distributed in the form of solid fuel, and gas or electricity.

c. Those in which the fuel is completely burned and electrical energy and steam distributed.

d. Those in which fuel is completely burned and electrical energy only distributed.

A consideration of these stations follows:

a. The by-product recovery producer plant is the most promising means of totally converting solid fuel into gas. Its economic importance lies largely in the high returns possible by the recovery of from 60 to 70 per cent. of the nitrogen in the fuel in the form of sulphate of ammonia. It is of great value for the exploitation of low-grade fuels, particularly peat, whose nitrogen content is high compared with its calorific value. The gas produced has a heat content of about one-fourth that of coal gas. It may be distributed to consumers or partially converted into electrical energy by use of gas engines or boilers and steam turbines.

In South Staffordshire a plant has been in operation for some years, and supplies gas over an area of 123 square miles. The price paid for the gas varies from 3 to 5½ cents per thousand cubic feet. The fuel used is slack coal of a fairly low calorific value. This is the only plant which distributes producer gas on a large scale, and it is noteworthy as a possible reason for its unique position that no dividends have been paid for some years.

In Italy two by-product plants, using peat, are in operation. The energy is distributed electrically.

b. The two outstanding objects of carbonizing coal are to obtain a maximum yield of either coke suitable for metallurgical purposes or of gas suitable for domestic purposes.

The first method of carbonizing is carried out in coke ovens, wherein the long time of carbonization, large size of charge and compression give a coke of the requisite great density and hardness. It is possible with modern coke ovens to obtain a yield of gas more than sufficient for heating the charge, about 20 per cent. of the nitrogen in the coal as ammonia, in addition to light oils and tar. The surplus gas is usually of only slightly lower calorific value than town gas, and is eminently suited for distribution for general use, or may be used as a fuel at the plant for the generation of electrical energy.

The second method of carbonization differs from the first, in that smaller charges are used in order to obtain the necessary quality and quantity of gas, none of which is used for heating the retorts. As with coke ovens, coke, ammonia, benzol, and tar are recovered as by-products from retorting coal. The yield of coke, however, is less, and some of it is used for heating the retorts, while the ammonia yield is greater, due to the smaller contact with the smaller charge.

The coke obtained from retorting the gas is soft and loose in structure, and may be used in domestic furnaces. Its disadvantages for this purpose are its bulk—which necessitates more frequent firing than with coal and larger storage space—and its tendency to clinker.

The choice of installing coke ovens or gas-making retorts, both of which require much the same class of coal, obviously depends upon the possible market for the products. The development of a domestic fuel trade in the soft coke is possible if a suitable market can be found for the gas. Metallurgical coke, on the other hand, is not so suitable for domestic purposes, since it is very hard, difficult to ignite, and requires a strong draft to burn it. Nevertheless, it may prove a valuable and economical substitute for anthracite coal, if sold at a reasonable price.

c. The third type of station represents the most economical means of generating power where coal is reasonably cheap and all the exhaust steam may be used for heating. The prime mover may be either a steam engine or steam turbine of a comparatively cheap type, and no condenser is required, since the power may be looked upon as the by-product and the steam as the most valuable product. It is not possible frequently, however, to find useful employment within a small area for the exhaust steam, and heat losses prevent the transmission of thermal energy in the form of steam or hot water over a large area. On the other hand, it may prove feasible to generate power in plants where a heating load exists and transmit electrical energy to customers in the neighborhood.

d. This is the most popular type of power plant and in large sizes consists of boilers, turbo-generators, and condensers. It is too well known to need description, but it is interesting to note that steam turbines are made of 70,000 kilowatt capacity, and operate with steam pressures and temperatures as high as 350 pounds per square inch and 690 degrees F.

Electric Railways

Street Railway Passenger-Fare Charts

By C. A. Cornwall

In all cities and districts served by a street railway system, there is a relation connecting the number of passengers carried per day and the fare charged. This relation is somewhat difficult to determine as there are at least three important factors which have to be considered, the first and most difficult factor being that which might be called the "human factor," that is, a factor covering the inconsistency of human nature. Second is a factor which might be called the "prosperity factor"; this factor would be dependent upon the prosperous condition or otherwise, of the place in question. The third factor is the "relation"; that is, the feeling, either good or bad, existing between the railway company and the general public.

These three factors may, within certain limits, be obtained in a combined form if the railway company has tried several different fares at various times, and kept a record of the variation in the number of passengers carried, corresponding to changes in the fare charged.

In a certain city with a population of approximately forty thousand there has been in the last three years, three changes in fares, and the corresponding numbers of passengers carried per day are shown in the "Fare-Passengers Carried" chart. During the three-year period covered by these fare changes the "prosperity" and "relation" factors would be practically unchanged, thus leaving only the "human" factor to determine.

It will be noticed that a line drawn through the three determined points representing the number of passengers carried per day at the different fares, passes through the forty thousand mark on the passenger carried scale when the fare charged has been reduced to zero. This result appears to be quite consistent as this number of passengers carried is the approximate population of the district served. On producing this line in the opposite direction it is seen that it cuts zero point of passengers carried when the fare charged reaches twelve and one-half cents. This also appears reasonable when it is considered that there are eleven routes of varying length in the system operated.

Referring again to the "Fare-passengers carried" chart it will be seen that:

$$\tan \phi = \frac{40{,}000 - N}{2{,}000\,F} \quad \text{or} \quad F = \frac{40{,}000 - N}{2{,}000 \tan \phi}$$

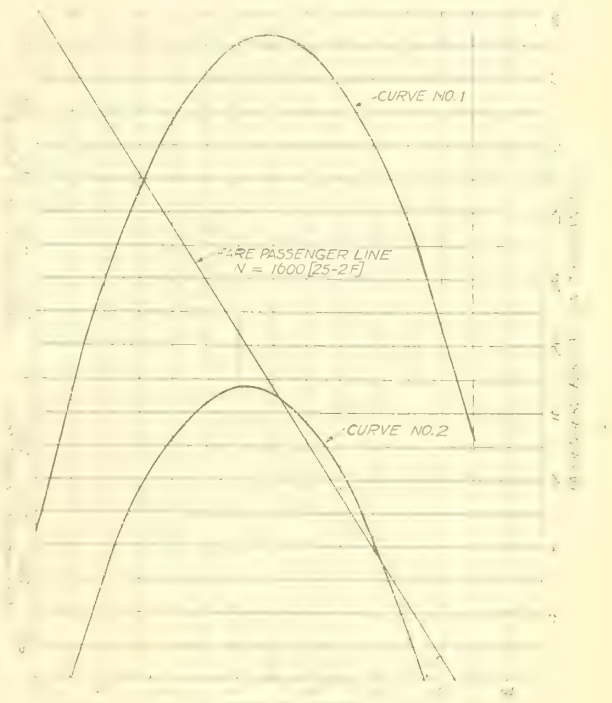
When:

N = Number of passengers carried per day.

F = Fare charged in cents.

ϕ = Angle which the "Fare-Passenger" line makes with the "Fare" line.

The factor 2,000 represents the relation between the passenger and fare scales.



In the case in question the angle ϕ is 58°, making:

$$F = \frac{40{,}000 - N}{3{,}200}$$

Having now obtained a value for N in terms of F it remains to determine the profit (positive or negative) per day for various values of F.

Let:

P = Profit per day in cents.

Fare-Passengers Carried Chart

E = Earnings per day in cents = NF = 1600 (25—2F)F.

C = Total operating cost per car per day.

N = Total number passengers per day = 1600 (25 — 2F).

$$X = \text{Number of cars running per day} = \frac{N}{AT} = \frac{1600(25 - 2F)}{AT}$$

A = Carrying capacity for each car.

F = Fare charged in cents.

T = Average number of half trips each car makes per day.

Now Profits = Earnings — Costs.

Or $P = E - CX$.

$$= 1600\,(25 - 2F)F - C\,\frac{1600\,(25 - 2F)}{AT}$$

Differentiating for P maximum gives:

$$F = 6.25\,\frac{C}{AT}$$

In the above equation it is assumed that the passengers are equally distributed at the opposite ends of a line and re-

the railway company. It also presumes that each car is filled to its capacity. These would be ideal conditions from the railway company's point of view, but are not to be found in practice.

Curve No. 1 is plotted from this general equation. The value of C/AT being taken as 1.15, P becomes a maximum when F = 6.82 cents and zero when F is either zero or twelve and one-half cents.

In practice it is generally necessary to run cars according to a certain schedule, and this schedule determines the number of cars used. When this is the case the cost expression in the equation becomes a constant. If this constant be taken as 127,000, we get the curve marked 2, which shows the system is operated at a loss for all values of F, the minimum loss being when F = 6.25 cents.

The writer would point out that great care would have to be exercised in making out and using these curves, but considers that in the case under consideration they are approximately correct between fare values of 3 and 7 cents.

Winnipeg Citizens' League Condemns the Jitneys

The matter of jitneys vs. electric railway service has been taken up in Winnipeg by the Citizens' Research League. Conditions in Winnipeg are such that the railway company, formerly a most prosperous organization, now finds it difficult to do much better than meet base operating expenses. As a natural result they will be unable to maintain the standard of service to which Winnipeg citizens have been accustomed and the Research League, realizing the facts, urges the suppression of the jitneys. Their recommendations in this respect were set forth as follows:

1. Service is limited, the jitneys plying only in the central, crowded, and therefore profitable parts of the city, but neglecting the suburbs and outlying residential districts. Moreover, there is no cross-town service and the service on Sundays and at nights is irregular, even on routes usually covered.

2. There is no routing of cars by the city.

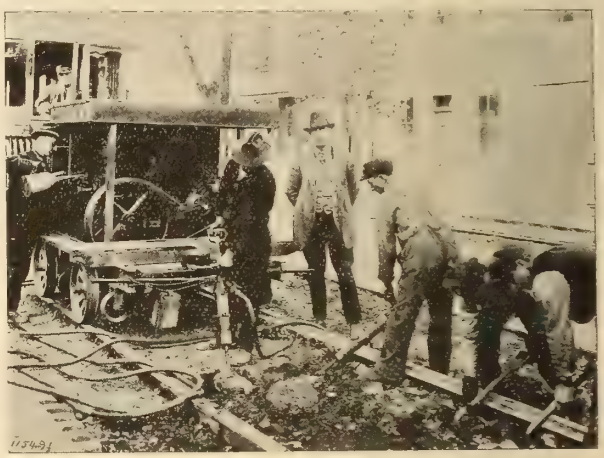
3. No time schedule is observed.

4. The jitneys are not required, as is the Street Railway Company:

(a) To give free transfers, cheap tickets for workmen and children, free transportation for members of the police and fire departments of the city when in uniform, policemen and detectives wearing a badge, and postal letter carriers;

(b) To contribute towards the upkeep of the city pavements;

(c) To hand over a definite percentage of their earnings to the municipality.



5. There is no financial responsibility for damage done, aside from a bond of $200 for property damage, $1,000 for personal injuries to an individual, with a maximum of $5,000 for any one accident.

It may be added that under present conditions the jitney involves wasteful employment of labor which could be much more effectively used elsewhere. The jitney hampers the financing of the Street Railway Company and prevents the raising of capital for additional lines or improvement of the service. In Professor Shortt's words, "instead of the electric street car being sacrificed for the preservation and extension of the jitney, the jitney should be sacrificed for the preservation of an electric service in the best interests of the public."

Apart altogether from the question of the rights of the Street Railway Company to an exclusive franchise for street transportation, the League holds that, unless the group of jitney owners can so organize themselves as to be held to a satisfactory agreement regarding the operation of their cars under terms corresponding to those governing the street railway, it is desirable to prohibit their general operation.

A Portable Compressor for Electric Railway

It has been said—and probably with entire truth—that there is not a sufficient number of men on any construction work in progress to-day. Hence, machines that can save a considerable amount of labor have become more imporant than ever in our industrial life. A machine of this kind, designed specially for the use of electric railways, is a motor-

driven compressor, mounted on a standard gauge truck and operated from the trolley circuit. The range of usefulness of this machine for track and road work is very wide, since it will operate tie tampers, track drills, chipping hammers for toothing out bricks, air blasts for cleaning rust from structural steel work, and many other pneumatic tools. The outfit consists of an 8 x 6 inch Ingersoll-Rand compressor, driven by a 15 h.p. 550 volt Westinghouse direct current motor, with starting rheostat, knife switch, and fuses. It is hauled to the job by a trolley car, and when connection is made to the trolley wire it is ready for use. Two tie tampers, chipping hammers, or other instruments can be used at the same time. Four small wheels, mounted at right angles to the main wheels, permit the outfit to be run off the tracks on heavy timbers. In a test made under continuous traffic conditions

it was found that the cost of tie tamping with this machine was one-half that of hand tamping, and better results were obtained, as no second tamping was necessary, due to settlements under traffic. Further, it was found that two men with the pneumatic tampers could do the work of ten laborers. Equally satisfactory and rapid results were obtained in tearing up concrete, clearing rust from bridge rollers and seats, drilling bolt and tie rod holes, pocketing and cleaning bricks.

The Dealer and Contractor

Remedy for the Ills of the Electric Merchandising Industry from a Contractor-Dealer's Standpoint—More Co-operation and a Closer Acquaintance Among the Members of the Trade*

We are all united in feeling that there are great chances for improvement in the electrical merchandising game. We, as contractors, are finding that we cannot solve these problems alone—we have invited you in to help solve these ever-changing problems. We are anxious to be shown. We come to you.

We ask you to show us what we can do to improve conditions among ourselves and in our relations to customers, jobbers, or central stations.

This isn't our fight any more than it is yours. We shouldn't be begging you to join this association. Our money and time is just as dear to us as yours is to you.

We have suffered from lack of co-operation, but we have profited from the sacrifice and good work of others. What do we propose to do? What do you propose to do? You say you will wait; you're not going to be the goat This is the fairest plan of assessment of which I know—to pay in proportion to the business you do. If you can't afford to do this, you better do less business and make more profits.

Merchandising

We must become merchants, carry a representative stock of appliances, and be prepared to put out new appliances on trial. Putting out sample lighting installation, installing heating devices, vacuum cleaners and washing machines are the up-to-date ways of merchandising. If we don't do this, the hardware or jewelry store will beat us to it. The hardware store will carry some of these appliances, but they are handicapped in not having practical electrical men to advise and repair. The mail order house may undersell you, but if you are in a position to demonstrate, try-out, and repair and exchange for different sizes you will get the business.

No Kicks Afterwards

We need men of vision who can suggest what will be needed on these jobs in years to come. Do you know that we have lost several jobs which we would probably have done by suggesting some of these extra openings The architect takes offence at these suggestions. The owner may think you a grafter. He will not after the job is done. I never yet had a customer kick on too many switches or openings after the job is completed. Get the job first, make your suggestions after. Most complaints are as to place, never because there are too many openings. Sometimes there are complaints of not enough openings.

Ills of the Industry

It is my intention to touch upon a few of the ills of the industry from the contractor's standpoint in his relation to his fellow-contractors, the lighting company, the jobber, manufacturers, and incidentally the electrical engineer and architect.

One of the most serious problems the contractor-dealer has is in relation to his fellow-contractors and dealers. He wants the business. He will have to lay off his men and even go out of business if he does not get work. A job is to be figured on. He has no intention of taking this job at a low figure, at cost, or even less, but as he begins to figure this he will incidentally think of the other contractor, and, instead of adding the amount for incidentals, the amount for overhead, and the amount for profit, all of which are rightfully his, he cuts off here and omits there. The result is he submits a figure which is away below what it should be. If he gets the job he is obliged to work practically for nothing, and his whole mind is centered on cheapening the job. He does not enjoy doing work under these conditions, and his feeling towards the other fellow leads him to dislike the other fellow as well as his own work. If the other fellow gets the job he may rejoice to think he was a lucky man, when, in reality, he would have done better if he had let it alone. Get a good price for your work.

Be a good loser. Many of us have shown our lack of generalship and our lack of business tactics by being sore because we didn't do the work by saying we had better stuff figured on, while, in reality, why not say: "I think you are going to get a good job; he does good work. Sorry we lost the job this time, but hope we can do business with you some other time."

Begin "At Home"

Our first remedy, therefore, is to begin at home, to so organize and pull together that no one man will feel that he is entitled to the cream. This means meeting on a common level at frequent intervals, both large and small contractors, looking the other fellow square in the face, admitting the wrongs and mistakes, and with a whole-heartedness agree to start in again with a clean slate, forgiving and forgetting. If you can't forget, forgive.

After all, our biggest enemies are often ourselves. Our imagination causes us to distrust and eventually to despise the other fellow. The habit of meeting frequently, of even calling our competitor over the phone, will head off much of the mistrust and misunderstandings that are so liable to exist.

The Central Stations

It has come to our notice from several parts of the state that there is a lack of harmony between lighting companies and contractors. This condition is unfortunate. A new factory is to be started; motors are needed. The lighting company is consulted as to the kind of current available. No sooner has the contractor asked for this information than a solicitor from the lighting company is there trying to sell motors, and even talking of installing them with the suggested argument that they are doing or can afford to do work cheaper than the contractor. Under conditions of this kind you can readily understand how anxious the contractor is to consult

* By W. R. Johnson before Wisconsin Dealers' and Contractors' Association.

company when the next job is in sight. How contractors are the best asset the lighting companies have. Contractors are the unpaid solicitors of the Central Station. We wouldn't be in business if it wasn't for the lighting company. The lighting company should be constantly in touch with every contemplated move affecting their load, and should do only those things which will encourage and stimulate confidence and trust between the central station and contractor. The contractor should try to please the lighting company and the lighting company should give the contractor all reasonable help, and I am glad to say in many localities this condition of co-operation exists. It results in better installations. When Jones is dissatisfied with his light bill and comes to the contractor, the contractor does all in his power to straighten out the trouble. If the contractor has done some work and the bill runs a little higher than the customer expected, he consults the central station, and how easy it is for the central station to assure him that the bill is correct, that the contractor always does good work—which generally settles the matter. We believe that as a result of the getting together of the local electrical interests as outlined in the Goodwin plan, these differences and misunderstandings between contractors and central stations will largely be done away with.

Now for the "Jobber"

The biggest contention against the jobber is that he will sell the consumer isolated plant, or factory at the same price or often for less money than we can buy it for. If we order a bill of lumber we have to pay the regular retail price for it, and if some carpenter contractor is called in to do the work he is entitled to his courtesy discount on that bill of lumber. This we believe is true in almost any other line of business. We see no objection against the jobber selling direct as long as the price is maintained. We are glad to say, however, that we have noted an improvement in this condidtion, and we believe this association will soon be in a position to show up any concerns who will not conform to the Goodwin sales plan and show them up so forcibly that they will be mighty glad to co-operate. If it is a question of credit and the dealer is entitled to a profit, goods may be shipped direct to the consumer and the dealer could be allowed his profit just the same. Further, if there seems to be no one to ship the goods through, the retail prices should be maintained.

A factory wants a signal horn system. They write to the jobber and to the manufacturer for prices, and they ask the local contractor what he can furnish these horns for. All these prices should be the same, and the suggestion should be given from the manufacturer that these goods may be purchased through the local jobber or the local contractor at the same price. As far as our experience goes, there is less complaint against the manufacturer, except possibly in the line of electric appliances, and yet we have every reason to believe that the manufacturer is going to stand with us absolutely on the Wheatstone Bridge sales policy.

The Architect and Engineer

There is a chance for improvement in the relation of the contractor to the architect or electrical engineer. The plans and specifications are not always clear or complete, and yet the writer never saw a set of plans which do not fortify the architect and owner and make reservations that are unfair to the contractor if the architect sees fit to enforce them. But we believe this new association is going to be so united and so broad in its scope that the architects will be glad to follow the "pull together" policy.

The Calf Analogy

The calf analogy is not quite true to the facts. It is only allegorical. There are big calves and little calves and some bully calves. If the bully is here with a pious look seeking whom he may devour, he should see the error of his ways before it is too late. If he is not here, it is the duty of this association, through its directors and field secretary, to show him up. When the calves woke up they were tired, hungry, their necks were sore, and I can imagine them saying as they got together: "We have done lots of work, but what have we accomplished We have spilled the beans. We have kicked over and wasted each other's profits. We have knocked each other's work and goods. We have looked with envy and hated each other. I'll scratch your back and you lick my ear. Let's go fifty-fifty on this one and when that one is ready we'll not scrap about it.

All Stand Together

In conclusion, I want to suggest that these are trying times, and that one of the biggest problems before this association to-day, whether it be manufacturer, jobber, central station, or contractor, will be not only to pull together, but to continue our business with as few interruptions as possible. With the scarcity of labor and material and the transportation facilities so badly blocked; with the fuel situation staring us in the face, it behooves us to stand together, borrow and lend both men and materials, practice economy, thrift, and efficiency more than ever. Good wages to the right workman and a good price for the job must result in an honest job with the best materials of sufficient capacity which will bring satisfaction to all concerned.

Jim Hare's Big Idea—The Story of an Electrical Dealer Who Seized an Opportunity*

There was really nothing wrong with Jim Hare, to begin with. He was just a normally ambitious chap, mechanically inclined and well known as the popular fix-it-up man of his neighborhood. Jim could work wonders with a screwdriver and a pair of pliers, which may or may not account for his drifting into the electrical business.

First it was bell hanging, then electric gas lighting, and finally the modern "Dirtless Workman" role of wiring residences. Jim's natural pride in his work, coupled with his ambition to lead in his line, kept him in the select class of electrical contractors who could be counted upon to wire an old house without marring the hardwood or tearing out the plaster. Jim was an artist in his business—and as jealous of his reputation as any artist that ever painted a picture.

Jim prospered. One job led to another, and before long Jim was renting a building with a store front. For a while this store front struck him as rather useless in his business, but then Mrs. Jim took a hand in things and the window became a bit of display advertising. She made a neat display of batteries, bells, wire, tape and tubes; had a sign made calling attention to the work that Jim did; had him mount an electric bell so that the hammer of the bell beat a tattoo on the window pane—and presto! Jim became an advertiser.

Naturally, as clever a workman as Jim was looked up to, the people he worked for asked his advice on everything electrical—and usually followed the course he suggested. Mrs. Customer asked him what he considered the best vaccum cleaner, or what was the best weight electric iron to buy, or how much good was an electric washing machine—and so the questions and answers ran on until Jim's fertile brain picked out the next good idea.

Jim became a regular merchant. He and Mrs. Jim talked things over and evolved a plan something like this: Instead of just handing out advice on the subject of electrical appliances, he would secure a line of them for his own shop, and then when the question came up he could answer it in such a way as to do him most good. Further than that, he would open up the subject by suggesting the various ap-

* By Tom Wright, in Contact.

pliances and Mrs. Jim would back it up by acting as demonstrator and actually making the sale in the customer's residence.

Studied His Prospects

Jim was now as keen a business man as you would want to find. The helpful literature that he got from the various houses he dealt with taught him many things about the art of selling and advertising. His trade magazines kept him in touch with the doings of his trade and many valuable ideas came to him in this manner. Jim had learned to study his prospects as closely as any good salesman should—and many a sale developed months after Jim's wiring had been finished, because of his keen analysis.

It was no longer a case of wiring a house for lighting. Jim felt it a blemish on his reputation to let that sort of a job go through. He went at it from the housewife's side of the question. He showed her the hours of hard work saved by a vacuum cleaner, the money saved by buying a washing machine; the convenience of a toaster and percolator, and there was always an electric iron to be sold—that was easier to sell than any of the others.

Jim took these things into consideration when he was laying out a job, too. He pointed out the need of a baseboard receptacle in the hall so that the vacuum cleaner could be used conveniently; he talked up the extra washing machine connection in the laundry and the special dining room socket that would be convenient to the table so that appliances could be used there. Jim played his game thoroughly. He did not get drawn into a conversation on the prices of these various appliances. He concentrated on first getting the extra sockets installed. He told stories of past jobs, how the people had thanked him over and over again for his assistance upon the extra sockets, how others had opposed him and told him later of their regrets. Jim had a good argument, backed up with stories right out of his day's work—and usually he had his way. Then started the workings of Jim's big idea.

The Mailing List

Jim prepared a mailing list of every person for whom he had ever done any work. He jotted down on the cards the sort of a job he had done, the type of house it was and what he thought they should have in the way of electrical appliances. He also made a note of the number of special sockets he had installed, their location, and a word or two descriptive of the house and its occupants. Jim's cards looked something like this—

Name	W. J. Hardie
Address	9768 West Boulevard
Date work completed	July 15th, 1916
16 Lighting Sockets, 5 extras for Vacuum Cleaner, Iron, Dining Room.	
Mrs. H. does own work. Children, rugs and draperies; have laundry.	

This information on a 3 by 5 inch card gave him all the necessary information for the next step in the Big Idea.

Step number two took the form of a neat letter to his mailing list. He might pick out all those he considered "iron" prospects and write a letter on that appliance, or he might pick a vacuum cleaner, or a washing machine. His letters would be something on this order—

Dear Mrs. Hardie:—

One thing that struck me about your home while I was working there last summer was the wonderful help that a Westinghouse Vacuum Cleaner would be to you in your daily work. Your rugs and carpets can be cleaned in about half the time by its use and the job will not be so tiresome or wearing upon you as sweeping. In addition to cleaning the rugs a vacuum cleaner will keep your draperies clean, renovate pillows, and bedding, and do away entirely with the need of dusting.

You have noticed that with sweeping it is merely a matter of raising dust that settles almost as soon as you finish and makes your work all the harder. With a vacuum cleaner this is all stopped. You really take up the dirt and when you are finished the matted dust in the bag tells you a story of perfect cleaning.

I am writing you this letter today because Mrs. Hare will be in your neighborhood next Thursday and I should like to have her show you just exactly what sort of a help a Westinghouse Cleaner is.

I hope that you will be at home when Mrs. Hare calls. You will not be obligated in the slightest by listening to her story and there is every possibility that what you hear will do you a real service.

Yours for lessening housework,

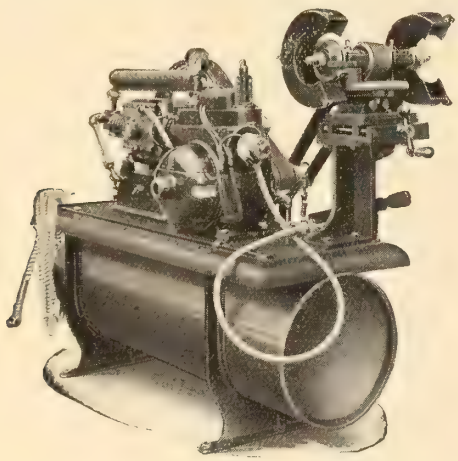
Jim Hare.

Jim kept hammering away at his lists in this manner. If the house had just been wired he told about those extra sockets and the message they had for the housewife. He played her up strong. Electricity was not just light—it was lightened house work. He pointed out the value of a woman's time, the endless hours spent in doing things that electrical appliances could do better—and the beauty of it all was the fact that the women were all for him!

Regular Reminders

Jim's letters are now regular callers at the homes of his prospects. Regularly once a month—sometimes oftener—they get a reminder of the services that electrical appliances stand ready to offer. During holiday seasons, Christmas, Thanksgiving, Easter, July 1, Jim has some new way of tying his store and its wares into the spirit of the occasion. His strongest point is reminding the man of the excellence of things electrical as gifts—and the men appreciate and take advantage of the tip.

As we said at the beginning of this story (which, by the way, has a good broad strain of fact through it) Jim was just a normally ambitious chap, and that's the secret of his success. He was normal, he saw things as others see them, he saw the vast benefits others were reaping by the use of the mails and decided that what was good for others was equally good for him.



Jim was right. His demonstrating is now done by young ladies who know the business—Mrs. Jim saw to that. His mailing list includes those whose homes he wired—and lots that have been wired by other fellows. He also goes out after wiring business, telling the prospect what others say about electricity, how easily the wiring can be done without excessive damage and enclosing a reply card which gives the prospect an opportunity to find out just what the whole thing will cost.

They call Jim a successful man in his home town—and he is. The beauty of it all though is the way Jim tells his story and points out the moral. With a badly bent stogie rolling from one side of his mouth to the other, Jim leans back in his chair, half closes one eye and says, "So you want the secret of it, do you? Well, secrets cost a lot sometimes—this one of mine in particular. The prescription is some postage stamps, some letter-heads, some plain ordinary common-sense letters written on those letter-heads, and then a real live list of people to send those letters to."

Did you ever hear of a medicine easier and more pleasant

Electric Driven Combination Air Compressor and Buffing and Grinding Head

The United States Air Compressor Company, Cleveland, Ohio, have recently announced a new combination air compressor and grinder outfit which is especially suitable for service in garages and similar places where compressed air is required. The outfit consists of a self-oiling air compressor with filtering trap, check valve and safety valve, buffing head, 30-gallon tank, air pressure gauge, needle-point valve, pipe and fittings, armored hose, automatic air chuck, six feet of armored cable with plug, all mounted on a metal base to form a compact unit, which requires but 48 x 20 inches floor space. The height over all is 40 inches. The air compressor is the air-cooled, two-stage type. The low pressure cylinder is 3 x 3 inches in size and the high pressure cylinder is 1½ x 3 inches. The working pressure is 300 pounds per square inch, and the capacity of the compressor is 4 cubic feet per minute. The compressor operates at 250 to 300 r.p.m. It is provided with an intake silencer, which muffles the intake noise and tends to force air into the intake valve. When the air in the main tank is raised to the proper pressure the automatic switch stops the motor and operates the automatic pressure release, which opens starting tank to the atmosphere. When the automatic switch again starts the motor it also closes the pressure release, and the compressor begins pumping against no pressure. It always starts without strain. When the air in the starting tank attains a pressure slightly in excess of

that in the main tank (requiring about 10 seconds) it opens the check valve and charges this tank until the proper pressure is reached, when the operations are repeated. A trap is provided in the starting tank, which extracts any moisture or oil that may be discharged from the compressor, assuring pure, dry air, free from oil. The buffing and grinding head is suitable for wheels of 8-inch diameter. The outfit is equipped with a one horse-power Robbins & Myers motor, which permits the compressor and buffing head to operate at the same time. Outfits without this buffing head are equipped with a one-half horse-power R & M motor.

New Flood-Lighting Projector for Standard Mazda C Lamps

A new flood-lighting projector, designed for use of 300 to 1,000-watt standard Mazda "C" lamps, has been placed on the market by the George Cutter Company, South Bend, Ind. It is called the "Standard" Flood-Lighting Projector. The new unit has the same general construction features as the Cutter "Universal" projector for flood-lighting lamps. These features include weather and fume-proof body or housing cast of aluminum or grey iron and forming absolute protection for the lamp and reflector; method of mounting permits of the projection of light in any direction in any plane; construction of the housing permits of the interchange of narrow or wide-angle-beam reflectors; sectional wire-glass doors minimize breakage. In the new "Standard" projector the socket is adjustable both horizontally and vertically for focusing the lamp or changing the width of the beam; when the adjustment is made the socket is locked in position. Reflectors are made of copper, heavily silver-

plated and finished with a coat of water and fume-proof lacquer. The narrow-beam reflector has a divergence of 10 degrees and the wide-angle-beam reflector a divergence of 30 degrees. They are designed to redirect the maximum amount of light from the lamp. This projector is listed in Bulletin 3338, recently issued by the company.

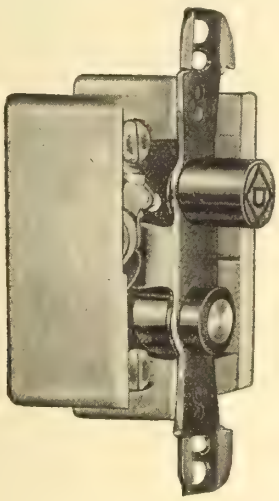
Last Word in Small Motor Switches

Herewith are shown illustrations of two switch condulets of the ZY series—the latest additions to the large family of conduit fittings manufactured by the Crouse-Hinds Company of Canada, Ltd., with headquarters in Toronto. One of the country's leading mill engineers described these condulets as the "last word in small motor switches." Whether his verdict is true or not, the fittings certainly have very much to commend them in design and material as well as in workmanship. As safety first fittings, ZY condulets seemingly leave little to be desired. It is claimed for them that they protect the switch operator and the person renewing fuses from shock; they cannot be operated by accident; they withstand the roughest usage; water will not drain into them, and it is impossible for lint or other inflammable particles to lodge upon the current-carrying parts and thus create a fire hazard. Both the body of the condulet and its cover are cast iron. Inside is a combined 20-ampere snap switch and fuse block. The switch is externally operated, and its handle interlocks with the latch of the door in such a way that the latter cannot be opened when the switch is in the "on" position. As a result of this arrangement, the circuit is dead when the door is open, and fuses can be replaced without danger of shock or short-circuit. As the machine operator or any other person not skilled in electricity can change

fuses with perfect safety in ZY condulets, their use saves all the loss in productive time, which is unavoidable where an electrician must be sent for to replace fuses. This, in the course of a year, means a considerable saving in the operating time of the average mill. The manufacturers list ZY condulets in one and two-gang forms and in sizes and ar-

rangements of threaded conduit hubs to meet various conduit wiring arrangements. They have also issued a folder on ZY condulets which they will mail free to any address upon request.

Hubbell Shade Holders



Harvey Hubbell, Inc., have placed on the market a line of brass shade holders of the three-screw type, for use with medium and mogul base weatherproof and porcelain sockets.

The attachment to the socket is accomplished by means of a clamp and screw arrangement. which guarantees a firm grip. The holders are given a bright dip and lacquered finish, making an attractive as well as useful device.

New Duncan Switch

The Duncan Electrical Company, Limited, of Montreal, manufacturers, are now offering a new push button flush switch in single pole and three way, called the Diamond D. These switches, as will be noted from the illustration, are so constructed as to have superb action, although only one inch deep. This shallowness is a splendid feature, as it allows ample room in box for wiring, which means easy installation. The Diamond D switches have been listed and approved by the Underwriters Laboratories of Chicago.

Toronto Electrical Contractors' Dinner

Following the regular monthly dinner of the Toronto Electrical Contractors' Association, held in the Walker House, Thursday evening, March 7, the members indulged in a lively discussion regarding the inauguration of a central bureau of reference and information. The need of such bureau was stated to be seen in the frequent practice of inviting tenders from a number of contractors merely to get a line on the probable cost of the work. Much valuable time was thus lost by the contractor without any chance of a corresponding advantage. It sometimes happens in such a case that one tender may be unusually low, due, not infrequently, to errors or omissions in figuring, and naturally such a tender is likely to be accepted, with disastrous results to the contractor. The idea of a central information bureau would be to enable the contractors to avoid these pitfalls. The details are being worked out by the executive, and a report will be presented at the next meeting.

Another question that received considerable attention was the licensing of contractors and journeymen. It is felt that the business has now reached a state where the safety of the public demands that irresponsible and unreliable men should be eliminated from this trade. Having this end in view, the executive were empowered to take such action as they thought fit.

The annual report of the St. Thomas Hydro-Electric Commission shows a total revenue of $98,393 for the year 1917. Of this amount $22,620 was derived from residence lighting, $14,843 from commercial lighting, $14,633 from street lighting, and the balance from sales of power, charging batteries. merchandise, and so on. A net surplus of over $5,000 was realized.

The Bell Telephone Company has cut in a new exchange at Lindsay, Ont. This replaces an old building.

Personal

Captain Richard P. Henry, late of the United States Army, has joined the selling forces of the Square D Company, Detroit, manufacturers of steel-enclosed safety switces, and has been appointed to the Indiana Territory, with headquarters at Indianapolis. Captain Henry spent three years at Purdue University, since which time he has been engaged in various branches of engineering work. His first position was that of assistant engineer for the T. H. I. and E. Traction Company, Terre Haute division. In 1912 he went with the Santa Susana Syndicate, Los Angeles, in the capacity of engineer and assistant geologist, and, later, entered the contracting business for himself, with offices at Chicago. He finally enlisted in the Engineering Corps of the United States Army, from which he was recently given an indefinite leave of absence on account of physical disability.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:
"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

Current News and Notes

Armagh, Que.

Work will proceed in April on a power development plant for the Armagh Electric Company, at Armagh, Que. A concrete dam will be erected, 62 feet high; reinforced concrete power-house; wooden penstock, 450 feet long, 36 inches diameter, and equipment will include 2 turbines and 2 generators of 200 h.p. each, 2,200 volts.

Brantford, Ont.

A contract has been awarded to the Canadian Westinghouse Company, Hamilton, Ont., for a motor for the sewage pumping station at Brantford, Ont.

Chatham, Ont.

The Dominion Sugar Company, operating a large plant at Chatham, Ont., have requested the Hydro-Electric Power Commission for a supply of 2,900 h.p.

Grand'Mere, Que.

It is reported that a number of business men of Grand'-Mere and Shawinigan Falls, Que., are organizing a company which will next month secure a federal charter and proceed with the construction of an electric railroad from Grand'-Mere to Shawinigan Falls. The distance is 9 miles, and the cost will be approximately $100,000.

Hamilton, Ont.

A Hamilton contractor was fined $10 recently for neglecting to take out a permit when installing some house wiring.

Kingston, Ont.

The Kingston electric railway was changed over to Hydro power on February 28.

London, Ont.

A 20-foot hole has been washed in the dam at Springbank, used by the London Public Utilities Commission to develop power during "peak" hours. Repairs will be impossible until more moderate weather sets in. The plant was capable of developing 500 h.p.

The London and Lake Erie Traction Company, operating an electric radial line between London and Port Stanley, have opened negotiations with a view to selling out to the city.

Montreal, Que.

The Bell Telephone Company's financial statement for the year 1917 shows gross earnings of $11,567,192, while net earnings amount to $2,534,071. Dividends totalling $1,440,000 were paid during the year and the surplus amounts to $533,-070. In his address the president, Mr. L. B. McFarlane, spoke of the difficulty of obtaining material during the year. Six thousand, six hundrd and ninety-one miles of wire were added to the long-distance system, increasing the total wire mileage to 82,716 on poles and 6.314 miles underground. The company have subscribed nearly a million dollars to the various war loans.

Ottawa, Ont.

The Ottawa Hydro-Electric Commission have announced a rate reduction of approximately 6½ per cent. Electric heating, it is stated, will now be available at a price equal to coal at $18 per ton.

Pterboro, Ont.

The Peterboro Utilities Commission announce an increase of $19,969 in the earnings of the Hydro-Electric Department in 1917, the total being $127,248. The net surplus amounted to $3,743.

St. Catharines, Ont.

At a recent meeting of the Niagara District Hydro-Radial Union, held in St. Catharines recently, the following officers were elected for the ensuing year: Honorary president, Sir Adam Beck; president, W. B. Burgoyne, St. Catharines; honorary vice-presidents, Dr. E. Jessop, M.P.P., Thomas Marshall, M.P.P., Dr. Jacques, M.P.P., Dr. Musgrove, M.P.P., Colonel Sharpe, M.P.P., J. T. Petrie, John Goodwin; first vice-president, W. G. Athoe, Ridgeway; second vice-president, L. B. Duff, Welland; treasurer, D. B. Crombie, St. Catharines; secretary, W. Charles Bush, St. Catharines.

Toronto, Ont.

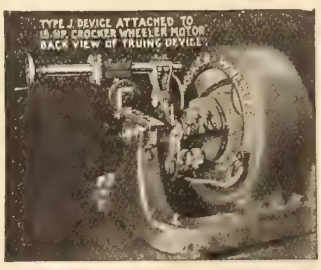
In spite of the fact that the Toronto civic car lines are piling up a deficit each year, the Board of Control steadfastly refuse to increase the fares from two cents to three cents. The total deficit to the end of 1917 is said to be $590,688.

Earnings for the Toronto Street Railway Company during the month of February amounted to $509,650, as against $473,185 for the same month last year.

The Hydro-Electric Power Commission of Ontario are now receiving 20,000 h.p. from the Canadian Niagara Power Company, which they were deprived of for some time owing to the breaking down of two generators at the Canadian Niagara plant.

Vancouver, B.C.

The British Columbia Telephone Company have announced the number of telephones in use in Vancouver on February 1, 1918, to be 27,025. In October, 1915, there were 22,891 instruments installed.



The Jordan Commutator Truing Device

Operates without removing armature. No shut down of motor or generator.

No large cuts from commutator and no unnecessary waste of copper.

No dragging of copper causing short circuits.

No portable slide-rest with the danger of the tool digging into the commutator and numerous other chances of damage to the commutator or armature which are all overcome with this machine.

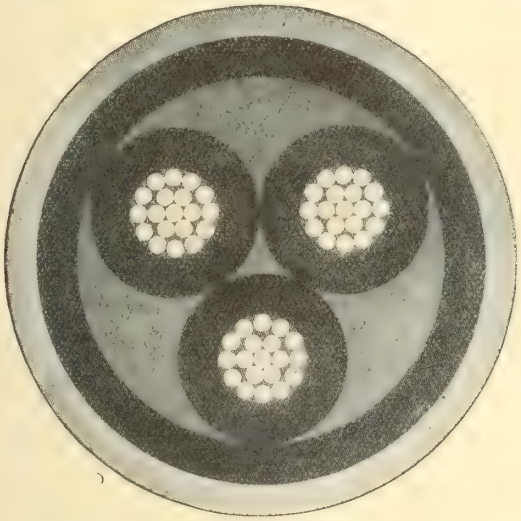
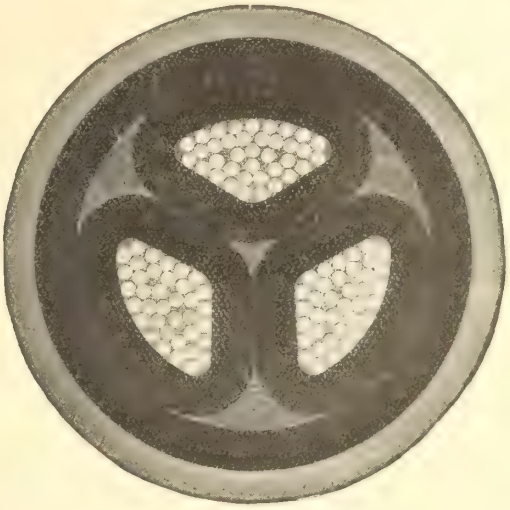
The Jordan Tapon for Moulding Work

A real time saver which means a Money Saver, making the best class of work.

It is not necessary to have the ends of the capping straight as the cover of the Tapon overlaps the capping, thereby covering any bad ends of capping.





JORDAN BROS., Inc., 74 Beekman St., New York

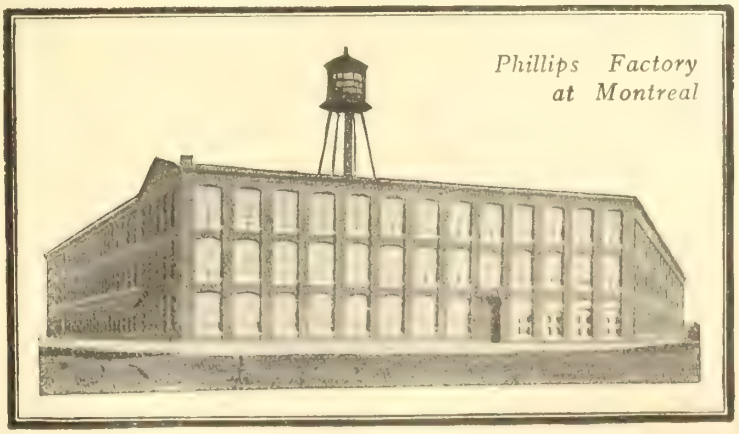
Jordan Tapons may be secured from your nearest Electrical Supply House.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in.. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

PARLIAMENT BUILDINGS, OTTAWA

Tenders Wanted for Switchboards, Panel Boards and Transformers

Sealed tenders will be received by the undersigned until noon, **March 25, 1918**, for the Switchboards, Panel Boards and Transformers required in the reconstruction of the above building.

All tenders to be based on the execution, completion and delivery on the site, together with the furnishing of all material, tools, appliances, labor, etc., for the work as required and described by the plans and specifications for switchboards, panel boards and transformers.

The work of this contract shall be proceeded with immediately upon the signing of the same and continued as directed, in such a manner as to insure the completion thereof by August 31, 1918.

Plans and specifications, and any other information required can be obtained at the office of the General Contractors, P. Lyall & Sons Construction Company, Limited, Ottawa.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Minister of Public Works, for a sum not less than five per cent. (5 p.c.) of the amount of the tender, which will be forfeited if the parties tendering decline to enter into a contract when called upon to do so. If the tender is not accepted the cheque will be returned. If the tender is accepted an additional cheque for a sum equivalent to five per cent. (5 p.c.) of the amount of the tender must be deposited before the contract is signed. The total security will be forfeited if the contractor fails to complete the work contracted for.

Certificates of payment shall be issued monthly as the work progresses and shall not exceed in the aggregate ninety per cent. (90 p.c.) of the value of the labor and material furnished and set out in the work.

The lowest or any tender not necessarily accepted.

Envelopes containing tenders to be marked, "Tender for Switchboards, Panel Boards and Transformers, and addressed to the undersigned.

Here's How One Dealer Drew Crowds to His Store

Acting on the theory that human curiosity can be aroused to good advantage by injecting an element of mystery into the window display, a dealer applied a variation of the ever-flowing bottle principle to a Westinghouse 5-cup percolator in his window. It took two people to keep the crowd back long enough to take a picture, after the feature had been in operation four days. The liquid is pumped up a glass tube bent to the shape of a stream flowing out, and runs down the outside of the tube.

Portable Welder

The Portable Welder is a new device for installing the time tested

ERICO WELDED BONDS

It can be easily lifted from the track by two men. There are no rotating parts and no flame or arc strikes bond or rail.

THIS TRADE MARK J OB IS YOUR GUARANTEE

Made in Canada

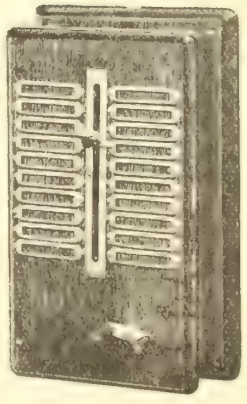
Water Turbines

Hydraulic Governors

High Efficiency Pumps

Vertical Turbines

shown in the accompanying illustration were designed and manufactured by us for the Hydro-Electric Power Commission of Ontario. They are among the largest water turbines installed in Canada and are characteristic of the high efficiency of our engineering department.



The services of these experts are at your disposal to consult on any of your engineering troubles.

BOVING HYDRAULIC & ENGINEERING CO., LIMITED

LINDSAY - ONTARIO

LOSING MEN

It is easy to lose track of a man in a plant of more than two departments. Just when you want him you cannot find him. Sometimes important matters are delayed while you are looking for the man that knows the details.

FINDING MEN

in a plant is also easy after you have installed a Presto-Call System. The Presto-Call is a Signal Service that we make in three sizes to call 5 men, 10 men or 20 men. It is easy to operate, and moderate in price; works with either vibrating or single stroke bells, or horns. The Presto-Call pays for itself in a few months.

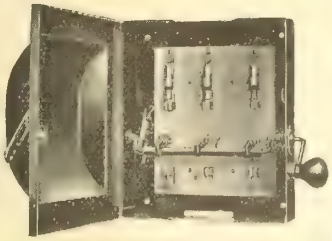
SQUARE D

STEEL ENCLOSED MOTOR STARTING SWITCHES

TO-DAY'S industry will influence the nature of our future peace. Maximum production is a vital necessity. Conditions demand the best in mechanical equipment. Machinery must be kept busy—shut-downs be avoided.



The Square D trade mark identifies THE ORIGINAL Safety Switch. Square D Motor Starting Switches, because of superior mechanical design and substantial construction, not only make your machines safe-starting but also help you to avoid costly interruptions of service.

Don't trifle with imitations.

R.C.O.C. CONTROL *now more efficient than ever*

IMPORTANT NEW FEATURES ADDED

A COMBINATION LEVER ATTACHMENT permits closing switches by hand to locate burnt-out lamps, avoid outages, etc. The load may be put out of service where White Way Systems are used only on certain nights. Where switches are put out of step they can immediately be stepped ahead. Just move a lever—that's all there is to do. Complete control is in your hands, at the power house and at each switch if required.

A NEW 2-IN-1 CASE is now provided for the Pole Type and Subway R.C.O.C. Switches. Where manhole space is limited this feature is of no small importance, for two switches in this new case take up little more room than the single switch case, conserving space and weight on pole line installation.

HERE IS WHAT R.C.O.C. CONTROL ACCOMPLISHES: At the Power House, using the regular series street circuit for the control wire, the operator controls series White Way systems having combinations of all-night and short-hour lamps on the same circuit; or multiple White Way Systems having all-night or combination all-night and short-hour lamps on the same circuit; or bridge, alley, sign, pump-motor circuits; or (a most important point) pole type or subway Constant Current Transformers controlling loops of series-circuits.. Watchmen, patrolmen, time switches and irregular lamp hours are things of the past in R.C.O.C. installations.

Write us to-day regarding your control problems

ESTABLISHED 1849
BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que.; Ottawa, Ont.; Quebec, Que.; St. John, N.B.; Toronto, Ont.; Vancouver, B.C.; Victoria, B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a **Specialist in Repairs.** Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants **quick work** and an **absolutely reliable job. You can give it to him.**

Make up your mind **now.** Say **"I'm going to get something out of the next repair job in this town."**

You have the work of taking out and re-installing the machine **(Profit).** Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the **Trade Discount (More Profit).**

Others are doing it. Why not you? Write about it.

Oxy-Acetylene Welding

Speeds up Production - Conserves Material

Automobile Crank Shaft successfully reclaimed by Welding

Whenever a problem arises involving the joining of metals (whether for manufacturing purposes or repairing broken equipment) Oxy-Acetylene Welding is almost invariably the solution.

No plant, however well equipped otherwise, is complete without an Oxy-Acetylene Welding Outfit to take care of the everyday repair jobs that a speeding up of production entails; and is absolutely imperative in order to completely avoid the disastrous consequences that must inevitably follow a serious breakdown, and the inability to obtain replacements.

We shall be pleased to give you all particulars as to the benefits to be derived from the Process in your Industry, without obligation, and your interest will be appreciated.

Electrical News

Generation, Transmission and Application of Electricity

MR. GEORGE A. HUGHES
President Hughes Electric Heating Co., Toronto

The Man who has made it possible

THE AMERICAN FUEL ADMINISTRATOR SAYS WE MUST SAVE 50,000,000 TONS OF COAL IN 1918

Coal Tonnage, Coal Car Congestions, Coal Wagon Blockades Relieved by Use of Electric Cooking Ranges and other Electric Household Devices.

USE of coal in kitchen ranges has been one cause of this winter's coal shortage and traffic congestion. It is estimated that, where the average family consumes 800 pounds of coal monthly for cooking, the central station requires only 262.5 pounds of coal monthly in order to supply this family with ample cooking current.

Moreover, coal cartage to homes, entailing car switching to numerous retail coal yards, and with the unavoidable stalling of coal wagons in congested streets, results in delays in loading and unloading cars of merchandise of all classes.

Electric cooking in homes helps solve these two problems. Where central stations operate from water-power, the entire coal consumption and coal transportation problems are eliminated. Where they operate from coal, they save the country over three tons of coal per family annually, they cut down car switching, and do away with the bulky, slow wagons.

Also, there is less shrinkage of food with electric cooking than with any other cooking process.

There is every domestic reason in favor of electric cooking—better food, greater cleanliness, less work, and more comfort—**no ashes, no smoke, no dust.**

The use at this time of electric ranges and household devices will help to meet the present national needs in the saving of fuel, labor, time, and transportation.

THE "S.J.B." BOX

FOR SERIES ORNAMENTAL STREET LIGHTING SYSTEMS

¶ To provide a means of disconnecting lamps from circuits supplied with current by two-conductor cable, The Northern Electric Company have recently designed the "S.J.B." Box for use on series circuits operating at potentials of 7,000 volts or less.

¶ Figs. 1 and 2 show front and rear views of the box, and Fig. 3 shows how the box is installed in the pedestal of a lamp standard. This view was taken in Montreal where all of the standards used in connection with the new lighting system are equipped with these boxes.

¶ There are many interesting features in connection with this box, but the limited space at our disposal does not permit of a detailed explanation. To those interested, however, we will be glad to send photographs and full descriptive matter on application to our nearest branch house.

222
TWO WIRE ONLY

333
THREE AND FOUR WIRE

Inter-connecting Metal Moldings

No. 222 is a neat molding easily installed. Connections to fittings are made without screws. Wires "stay put" when laid in. Capping is secured with Spring Clips after all connections are made and the system tested.

No. 333 has not been changed in design. It will carry a three-wire circuit or two two-wire circuits. Through the use of simple fittings, is inter-connecting with No. 222 Systems.

Either or both make a good looking job and a good job.

Complete Descriptive Bulletin 101 sent on request.

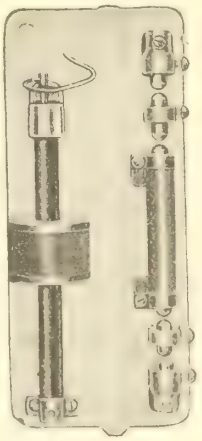
Lightning Flashes



may instantly burn out your apparatus if not protected with—

Garton-Daniels Lightning Arresters

In nearly every station, on nearly all lines, you find the Garton-Daniels—the one type of lightning arrested that has remained unchanged in principle through more than a quarter century of service.

Think of it! For over 25 years they have been protecting many millions of dollars' worth of electrical apparatus. And they have been doing it right, because their small air-gap distance, low series resistance and positive mechanical circuit breaker form a combination which is the most efficient and reliable lightning protective unit known.

And right now, before lightning flashes actually interrupt your service and probably burn out some apparatus, it is indeed the time to consider lightning protection and buy sufficient Garton-Daniels Lightning Arresters to protect all of your apparatus.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

A great deal has been claimed for the effectiveness of various headlight lenses in eliminating glare, yet everyone knows that glaring headlights remain a positive menace of the road.

Hence it is reassuring to know that one lens embodies something more than theory—something **tangible** that must produce glareless lights.

This lens is the **Holophane.**

The **Fin is the exclusive feature of the Holophane Lens.**

Look for the name **Holophane** on the flange. Do not accept substitutes.

Glareless Light

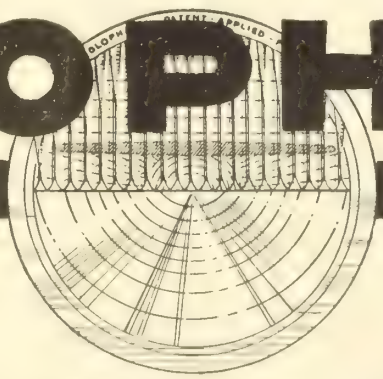
The **Holophane Lens** is a unique product made by the acknowledged leaders of the world in scientific lighting—a lens that embodies a fin or shelf of specially treated glass, which extends backward just above the bulb of the lamp, placing a positive shield between the light and the eye of the approaching motorist.

Elegant Appearance

Unlike other lenses, the **Holophane** adds to the appearance of any car—even the handsomest. The **Holophane** has the sparkle of cut glass and the clearness of crystal.

Brighter Light

The same scientific construction that makes the **Holophane Lens** supreme in eliminating glare also causes it to give **brighter illumination** than any other. A newspaper may be read 385 feet away.



Holophane Prices

Diameter	Per Pair.
7 to 8¾ inches	$3.60
8⅞ to 9⅝ inches	4.50

"SPRACO" COOLING PONDS

For Condensers, Cold Storage and Refrigeration Plants

The SPRACO Cooling System is the simplest, most economical, and efficient device in existence for cooling water used in condensers, water-jackets, transformers, evaporators, and other equipment where the conservation of the water supply is essential.

SPRACO SYSTEM FOR COOLING, CONDENSING WATER, ETC.

The hot water delivered to the system is cooled by spraying through specially-designed nozzles, producing a finely divided spray at low pressure. The cooling is effected by evaporation, radiation, and convection, the water falling into an artificial or natural pond, sufficiently reduced in temperature, to permit of its being used over again.

The principal advantages of a spray system over a cooling tower are: Lower initial and maintenance cost; greater saving in power required for operation; longer life; reduction in make-up water requirements, and greater flexibility.

The wide experience of our engineers is at your service

Robbins & Myers Fans

THE instant you pick up a Robbins & Myers Fan you get an impression of the great strength and rigidity of its construction.

There's no springing or bending in the strong steel guard, no shake or looseness in the securely bolted-on steel guard arms. So rigid is the construction, so accurately fitted and securely attached are all parts that when you handle an R & M Fan it feels as though you were holding a one-piece article rather than a machine of many parts.

The drawn-steel frame and base are extra weight—3/32 of an inch in thickness—and the frames are stronger than cast iron frames, which are two and one-half times as heavy. The bearings are the best-grade phosphor bronze, liberal in size and accurately machined. The blades are heavy sheet brass, and are mounted on a steel carrier. The windings are heavily insulated and mounted in place securely.

Every detail is built to give long, reliable service, to make pleased customers and easy sales for the dealer.

Vol. 27 Toronto, April 1, 1918 No. 7

Save Coal by Eliminating Isolated Plants

As a result of the coal shortage an investigation is under way by the Public Service Commission of New York to ascertain what saving could be made, if any, by the substitution of central station service for private plants in various classes of buildings. Mr. J. W. Lieb, vice-president of the New York Edison Company, submitted data on a number of typical cases. He also estimated the total saving if the 650 odd private plants were turned over to central station service at 500,000 to 830,000 tons.

Specific Instances

Case No. 1.—An eleven-storey office and loft building plant had been closed down in the early part of 1917. Data were collected for a period of ten months and compared with the corresponding ten months of the previous year under private-plant conditions. The private plant had consumed 1,316 tons. Under central-station service for light and power there had been 541 tons consumed at the building for heating and similar purposes, and 159 tons at the central station to generate the electrical power deilvered—or a total of 700 tons. This represented a saving of 616 tons, or 47 per cent.

Case No. 2.—A five-storey and basement building. One year of private-plant operation consumed 7,237 tons. With central-station service—2,927 tons for steam heating on the premises, 1,403 tons for Edison energy supplied; total, 4,330 tons. Saving, 2,907 tons; 40 per cent.

Case No. 3.—Apartment house. The annual coal consumption, average of three years, was 2,107 tons. With central-station service the annual coal consumption for steam heating (average of two years), was 1,113 tons; for producing electrical energy supplied, 193 tons; total, 1,306 tons. Saving, 801 tons; 26.3 per cent.

Case No. 4.—An eight-storey apartment. Annual coal with private plants, 750 tons. With Edison service, 240 tons on the premises, 178 tons at the central station. Saving 332 tons; 44.5 per cent.

Case No. 5.—An apartment building. Annual coal consumption with private plant, 6,200 tons. With Edison service, 5,212 tons on the premises and at the central station. Saving, 988 tons; 15.9 per cent.

Co-operative Buying of Lamps and Appliances by Central Stations

Thirty thousand portable lamps of a standardized design are to be placed on the market next fall as the result of a recent conference in New England between a group of central-station men and a fixture manufacturer who is handling this order on an off-season basis. This co-operative buying plan includes central stations from some of the largest cities in the country, whose representatives met informally to develop the program of securing a fixture at low cost for multiple production and wide distribution. The movement promises far-reaching results in the large-scale merchandising of electrical appliances. Those behind the plan state that individualism has been overplayed in many lines of electrical selling to the general public. They believe that certain standardizations of design can be accomplished to appeal to a very wide market, and that, through the concentration of orders and through intensive production, costs can be lowered to a point which will mark a new stage in the popularization of electrical merchandise.

These central-station men recognize, of course, that no standard design of portable lamp will suit the entire market, but they believe that a large buying power exists among the public for a low-cost standard product of general application. It is believed that a great many persons will be glad to purchase a portable lamp of uniform design, wholly regardless of the fact that other people may be using the same product, provided that the price is low enough.

The matter was discussed with a certain manufacturer, and a design of portable lamp has been prepared which is expected to meet an extremely wide range of service conditions, applicable to business and home surroundings. The central-station men present represented the sales departments of their several companies, and it is noteworthy that some of the smaller cities represented were among the heaviest underwriters of the plan.

Owing to its being the dull season in fixture production, the manufacturer was willing to take the order upon a very satisfactory basis of cost. The raw material for these lamps has been purchased on a more satisfactory basis of price and delivery than applies to small and individualistic orders for scattered shipment at odd times. The manufacturer has been enabled to plan his production for steady output during the off season, and the various central stations will receive these lamps at a price, it is said, which will enable them to market them at about the former factory cost level.

Fires Due to Electricity Many Less Than Reported

It frequently has happened in the past that electrical men are amazed and, incidentally, gas men delighted, at the government reports covering the number of fires caused by electricity. For example, quoting from the Public Service Bulletins of the last few months, we have in July, 1917, 33 fires attributed to electricity defects; in August, 25; in Oc-

[illegible] 11, in November, 30; in December, 21 and in January, 1918, 32.

It is much easier to issue a report of this kind than to prove that the report is wrong, however satisfied one may feel that the evidences used in arriving at the conclusions have not been dependable. Some light was recently thrown on the situation, however, by the Toronto Inspection Department, who were naturally curious to learn why so many Toronto fires were blamed to wiring defects when very few were reported to the Inspection Department. In a recent issue of a Toronto daily paper it had been stated that defective electric wiring had been responsible for ten fires during the previous month. This matter was made the subject of enquiry by the District Inspector of the City of Toronto at the headquarters of the Chief of the Fire Department, who was responsible for the report, and the following interesting list of the ten fires attributed to defective wiring was submitted in evidence:

No. 1—Street Car No. 1318, Cor. Terauley and Louisa.

No. 2—Street Car No. 624, Cor. College and Bellevue.

No. 3—Automobile; owner, New Method Laundry; short circuit.

No. 4—Street Car No. 1298, Cor. Yonge and Cumberland.

No. 5—Street Car No. 1416, Cor. Queen and Herbert Sts.

No. 6—Street Car No. 852, Cor. Dupont and Christie.

No. 7—Street Car No. 593, Cor. Avenue Road and Bloor.

No. 8—Street Car No. 1274, Wilton and Parliament Sts.

No. 9—17 Montrose Avenue; insulation on electric wires became ignited.

No. 10—871 College Street; A. E. McCurdy; insulation on wires became ignited.

It will thus be seen that defective wiring was made to bear the brunt of ten fires which, so far as the general public is concerned, were huge conflagrations involving the loss of several hundreds of thousands of dollars, when in actual fact, they were mere blow-outs confined to individual street cars which, so far as we are aware, did not even involve running these cars in for repairs. Electricity has a perfect right to bear the blame of all the fires for which it is responsible but that insignificant occurrences of this nature should be placed in the same category with the fatalities and heavy financial losses which result from the use of gas, or from other causes, is manifestly unfair. We understand that at the present time a different classification of fires is being made in the city of Toronto so as to correct this false impression, but, so far as we know, the old methods still hold throughout the province.

Would it not be well, now that the province is pretty thoroughly covered by district inspectors, if the government should depend for their information on these inspectors instead of on fire chiefs or other men who have no knowledge of electrical matters?

Activities of Toronto Section A. I. E. E.

If nearly fifty per cent. of the local members of a society attend the meetings to hear a technical paper and twenty per cent. of these take part in the subsequent discussion it is safe to say that the society is a live and enthusiastic one and is doing good work. This is the record of the local section of the A. I. E. E. in regard to the meeting which assembled on March 15 to welcome Mr. J. J. Frank, of the General Electric Company, Pittsfield, and to hear his paper on "Modern Transformers." The paper was a most entertaining one, tracing as it did the development of this form of electric apparatus from its very earliest stage and the lecture was punctuated with a very large and well chosen series of lantern slides. It is difficult to overestimate the value to electrical engineers in Toronto of being able to discuss transformer design with a recognized expert like Mr. Frank; to debate the advantages of the different methods of cooling and oil and water circulation and the means of bringing out taps. Such papers as this are an asset to electrical engineering life in Toronto.

The next meeting of the Toronto Section is to be held at the Hydro-electric Laboratories on Strachan Avenue, on Friday, April 5, when Mr. W. P. Dobson is to read a paper on High Voltage Testing. Many of us are not sufficiently aware of the magnitude of the work undertaken by the Municipal Laboratories, and in this respect Mr. Dobson's paper, with its accompanying demonstrations, will be especially instructive.

Described Cambrai Experiences

Lieut. H. L. Phillips, of Montreal, who was in charge of a tank at the battle of Cambrai, described his experiences at the front at the meeting of the Montreal Electrical Luncheon on March 20th. He referred to the individuality of each tank, and said it was essential that the men should thoroughly understand the working of the machines; otherwise there was a great liability of a breakdown, with serious consequences. Lieut. Phillips gave details of the Cambrai battle, speaking of the initial success and the subsequent partial recovery of the ground by the Germans. Cambrai was, he said, the first battle in which the wire was cut down by tanks instead of by gun fire. Tanks were called "assaulting artillery" by the French, and they were of great value if attacking, although of little use in defensive warfare. They were proof against machine guns, but not against shell fire. Lieut. Phillips also briefly summarized the general war position, and concluded by an appeal for still greater sacrifices in order to win. If the allies did not win it meant that the children of the people in the British Empire would in a few years' time be fighting again for the same ideals as were involved in the present conflict. As one who knew from experience the worst side of war, he was convinced of the absolute necessity of a successful conclusion to the war.

Toronto Electric Club

The weekly luncheons of The Toronto Electric Club have been well patronized during the past month. Probably the best attendance of the year to date greeted Professor St. Elme de Champ on Friday, March 22, when he addressed the Club on Alsace-Lorraine. Professor de Champ spoke to combat the propaganda, at present being so assiduously carried on by the Germans, that Alsace and Lorraine are German and hold German sympathies. He quoted from legion authorities showing not only that the Germans look upon this territory as "enemy" territory, but that the people of these two countries despise and hate the Germans and submit to their rule only because they must. This evidence is further borne out by the fact that no less than 30,000 Alsatians have deserted from the German army during the present fight with the French.

Friday the 29th being a holiday, there was no meeting of the Club. On April 5 the guest will be Lieut. R. W. Harris, and on April 12, Col. Williams. Mr. H. M. Hooper, Canadian Westinghouse Company, is chairman for the month of April.

Electrically Operated Filtration Plant

The St. Hyacinthe, P.Q., civic filtration plant, now near completion, is to be electrically operated. The new De Laval pumps are to be direct connected to 3 phase, 60 cycle, 2200 volt, a.c. motors, by the Canadian Westinghouse Company. The blower for supplying air for making the filter beds, the agitators, and other equipment will be driven by electricity.

Transmission Line Practice—Some High Voltage Problems—Article IV.

By Lieut. E. T. Driver and E. V. Pannell

The rapid increase in operating voltage which has marked the transmission line art during the last decade has been dictated not only by the long distances of transmission but by the large amounts of power to be conveyed. Naturally enough the old rule of thumb of "one kilowatt per mile" was soon outclassed when energy had to be transmitted more than one hundred miles and some of the very highest voltages today are in use upon systems where this quantity amounts to less than half a kilowatt per mile. On the other hand, there exist several systems of forty or fifty miles in extent which are working at or around 100,000 volts. This permits of ample extension to the system without any change in the voltage, but the most important factor where large amounts of power are handled is the reduction in the cost of the conductors. The power to be transmitted is just as important a factor in estimating the operating voltage as is the distance; indeed, the latter is a very ambiguous expression because the power station is usually the centre of a network of transmission lines all of different lengths.

It is desired to treat more particularly of the influence of high operating voltages on the mechanical design of the line. With the advance in voltage and the consequent wider spread of conductors longer and stiffer crossarms were called for. Steel channels were adopted and later steel towers to support them and to yield the benefit arising from the longer spans and the use of two circuits on the same structure. When pressures in excess of 60,000 volts became usual the limitations of the single pin type insulator began to be felt and the suspension string was introduced. This type of insulator has several important influences on the design of the line, one of which is that since it supports the cable some 4½ feet below the crossarm, whilst the pin insulator holds

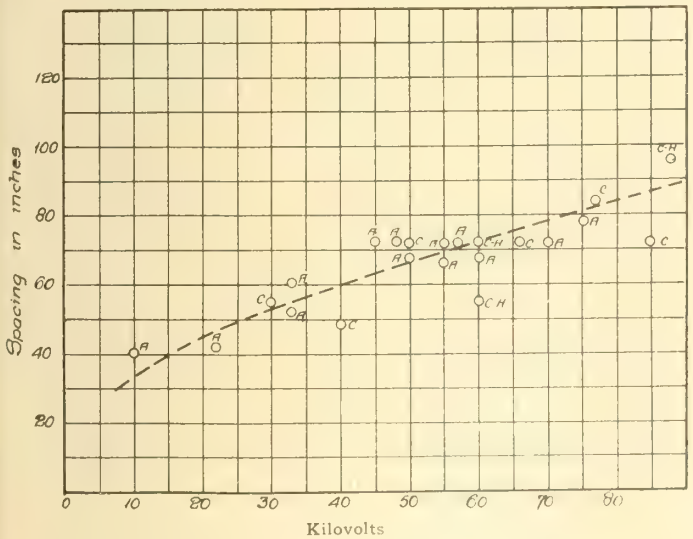

Fig. 12—Conductor spacings with pin insulators
(C denotes copper; C-H copper-hemp; A aluminium)

the conductor about 1½ feet above it, the former requires an overall height of tower about 6 feet in advance of the latter.

The spacing between the conductors is influenced by the voltage, sag of conductors and the type of insulator. Tables of standard recommendations for spacing are frequently published, but they must always be modified according to local conditions. With pin type insulators the equilateral triangle is still by far the best and most popular method of arranging the conductors, but with suspension strings this leads to a very long middle crossarm or also two cables strung on one side of the same arm. Both expedients are undesirable, and the most usual arrangement consists of the three conductors of a circuit being just slightly staggered out of the vertical plane sufficiently to avoid contact when "sleet jump" takes place. Fig. 12 shows spacings actually in use on a number of transmission systems using pin type insulators, and Fig. 13 is a similar diagram for suspension insulators. It will be noted that even for the same voltage, where the curves overlap, the spacing is considerably greater with the suspension string on account of the swinging proclivities of this form of insulator.

It is sometimes claimed that one or other conductor material requires a greater spacing than is usually adopted

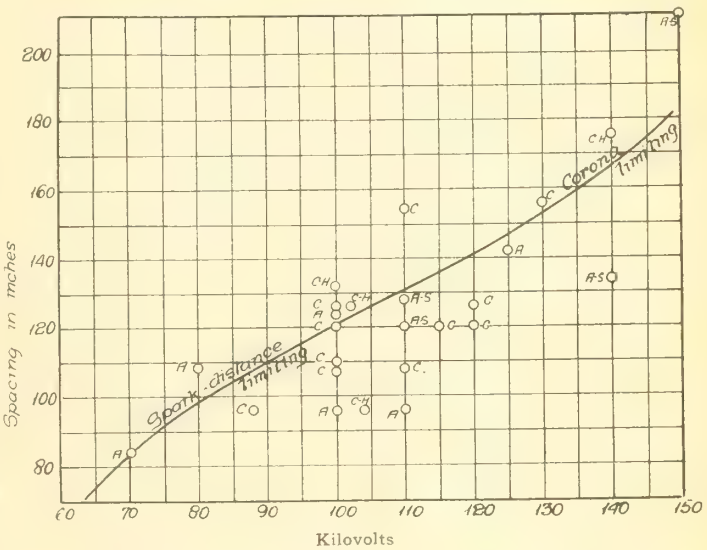

Fig. 13—Conductor spacings with suspension insulators
(C denotes copper; C-H copper-hemp; A aluminium; A-S aluminium-steel)

and hence involves more costly construction. In these two figures the kind of conductor employed has been indicated, and it will be seen that there is really no rule for spacing aluminium wider than copper or aluminium-steel closer than copper. Local wind, ice and temperature conditions are the most important factors. There is no very great diversity in the matter of spans and sags among the points plotted on these diagrams, probably the average conditions of 600 foot span and 25 foot sag govern the generality of them.

Whilst the spacing of the wires up to voltages of about 80,000 is governed by sparking distance under abnormal conditions which would swing the conductors close together, a different phenomenon controls the spacing as the pressure is increased above this limit. This is the factor of corona. Our present knowledge of corona losses is based very largely upon the investigations made by Mr. F. W. Peek, of Pittsfield, Mass., and published in the A.I.E.E. Transactions during the last eight years. The fact that at a certain potential gradient around any conductor the air breaks down as an insulator has long been known, but it has remained for Mr. Peek to codify this law so as to render it easily calculable for transmission line work. Briefly stated, at a certain definite critical voltage, corona will appear. It will increase very

[illegible] with any rise in the voltage beyond this point. The value of the critical voltage (e_0) is

$e_0 = 2.302 \times m_0 \times g_0 \times r \log_{10} d/r \times \lambda$

where m_0 = irregularity factor varying from 1.00 for a clean solid wire down to .083 for a seven strand cable.

g_0 = breakdown potential gradient of air, 53.6 kilovolts per inch.

r = radius of conductor, inches.

d = mean spacing of conductors, inches.

e_0 = critical pressure in kilovolts.

λ = air density.

It will be interesting to calculate the critical voltage for

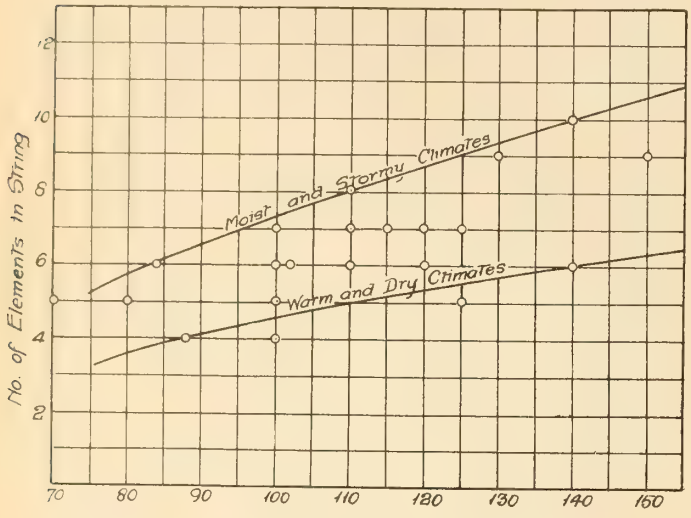

Fig. 14—Number of elements used in suspension insulator

a typical transmission line operating at 110 kilovolts with seven strand 0 B&S cables spaced 96 ins. apart. The radius of this cable is .188 ins., and assuming λ as unity:

$e_0 = 2.302 \times .83 \times 53.6 \times .188 \times \log 96/.188.$

$= 52$ kilovolts.

This is, of course, the critical voltage measured to neutral, and in order to compare it with the line voltage the latter must be reduced to the same terms by dividing by $\sqrt{3}$. This gives the operating voltage to neutral, as 63.5 kilovolts an excess of 11.5 kilovolts over the critical pressure. High altitude or stormy weather will reduce the factor λ and so decrease the critical voltage still further. Now the losses which arise from the corona discharge are given by the equation

$$P = \frac{k'}{\lambda} \times \frac{f}{10^5} \times (e - e_0)^2 \sqrt{\frac{r}{d}}$$

where k' = constant = 552.

f = frequency.

e = operating kilovolts to neutral.

It is important to note that the losses increase as the square of the difference between the critical and operating voltages. They are also greater with higher frequencies and are less for liberally spaced conductors. Assuming a frequency of 60 cycles and following the foregoing example:

$$P = \frac{552 \times 60 \times .0445 \times 11.5 \times 11.5}{10^5}$$

$= 1.93$ kilowatts per mile of wire.

Under working conditions there will probably be two three-phase circuits so that the total loss per mile of line will amount to $6 \times 1.93 = 11.6$ kilowatts. It must be emphasized that the above calculations for a typical example yield only the fair weather loss and that any atmospheric disturbance would lower the barometer and result in a lower critical voltage and increased losses.

As a matter of actual fact it is, of course, incorrect to assume the same voltage over the whole line, and since the corona discharge is determined by the difference between the critical and the operating voltage at any point it is the most satisfactory method of calculation to divide the line up into sections assuming the operating voltage (e) to be uniform over a whole section.

It is not a difficult or an expensive matter to design a line of the highest operating voltage which shall be free from corona troubles. Liberal spacing and large size conductors are the necessary factors in the elimination of the losses. It was shown in an earlier article in this series that copper yields the smallest of a group of conductor materials, all of which have otherwise good characteristics. It is here found that the very factor which is somewhat of a drawback to the use of aluminium, copper-clad-steel, or aluminium-steel, namely, the larger diameter, is a valuable advantage for working at very high voltages on account of the relative freedom from corona. Aluminium or aluminium-steel cables have respectively 28 and 43 per cent. greater radii than the equivalent copper with a consequently higher critical voltage.

In Fig. 15 are shown the highest voltages for which a system can be designed without corona being in evidence under fair weather conditions. From this it will be seen that there is relatively little difficulty in transmitting with cables of 4/0 B&S or larger, but with smaller sizes of conductor it becomes next to impossible to avoid corona without extra wide spacings. The remedy lies in the sale and transmission

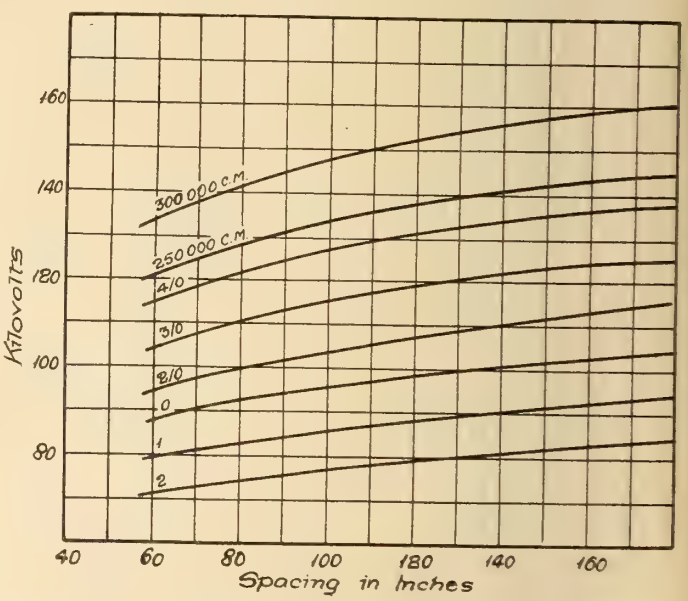

Fig. 15—These curves show the maximum operating voltage which will not yield corona in fair weather

of still greater amounts of energy so that cables of at least 4/0 B&S can be economically loaded and used.

Regarding actual experiences with corona there have been few practical tests made under working conditions. These losses are included with other stray power losses throughout the transmission line so that it is difficult to assign the correct value to the corona. As a matter of fact, wherever corona has made its appearance and been measured, it has never been found to be less than the calculated value. On the lines of the Central Colorado Transmission system the altitude averages 8,000 feet and the phenomenon is met with. The cables are of 0 B&S copper, seven strand with a hemp core, and the critical voltage for this altitude and conductor size is very nearly 100,000 kilovolts, which is also the operating voltage. It is also claimed that the radio-active properties of the pitchblende which occurs in the district, are responsible for a partial ionization of the air, thus indirectly reducing the critical voltage.

On the Au Sable Company's transmission lines in Eastern

Michigan corona is also experienced; the operating pressure is 140 kilovolts and the cables are seven-strand 0 B&S copper with a hemp core. In a report on this line it is stated: "Experience at Au Sable proves that transmission at 140,000 volts is an economical procedure but it should be made clear that such a pressure is justified only where the distance and the quantity of power to be transmitted are such that conductors of sufficient section to prevent corona are economically used. While it has been suggested that hemp centre cables might provide increased cylindrical areas and so raise the corona limit, the fact remains, according to the experience of the Au Sable Electric Company's engineers, that such hemp centre cables show a greater corona loss than equivalent all copper conductors."

Joint Committee of Technical Organizations

Holds Annual Meeting—Chairman Alfred Burton Reviews Year's Activities Before Large Attendance

To the Technical Men of the Province of Ontario:

Gentlemen: Your committee has pleasure in submitting its second annual report, covering activities during the period elapsed since our first annual meeting in March, 1917. Meetings of the joint committee have been held monthly during the year to hear reports from the executive, deliberate on questions of policy, and appoint and instruct sub-committees. The executive committee have held about 40 meetings.

Finances

Up to September, 1917, the expenses of the joint committee were carried entirely by private subscription. Since that date, largely owing to the generous recognition of services rendered to the Imperial Munitions Board, we have had less difficulty in defraying our running expenses. The chief items consist of the rental of a small office, the salary of a stenographer, and the cost of printing, postage, etc.

Changes in By-Laws

A slight alteration has been made in the wording of our by-laws so that the committee now includes a representative from the Canadian Manufacturers' Association.

This was deemed highly desirable on account of the close relationship existing at the present time between the technical and industrial activities of our country. The wisdom of this addition has been amply justified in the valuable assistance the representative of that association has rendered your committee.

Inventions

One of the most important activities of your committee, and one which we are pleased to feel has been of real assistance to the Imperial Munitions Board, has been the study of the various and varied inventions submitted to that board from all over the continent. These inventions, in the main, have reference to war activities, such as improvements in aeroplane design, detection of submarines, etc. Some idea of the amount of work entailed may be gained from the fact that detailed reports have been made to the Imperial Munitions Board during the past year on almost 100 inventions. This work has been handled through the medium of a special sub-committee, whose work is deserving of a very grateful and special mention.

Aviation

A sub-committee has been formed for the study of aeronautical problems. The work of this committee, which is of recent creation, has consisted to date in compiling information, and, in general, getting in touch with the various phases of the work through correspondence and personal interviews. It may be too much to expect that this committee will be enabled to carry out any experiment which will have any direct bearing on maintaining the supremacy of the Allies in France, but such a group of men, with intimate knowledge of the subject of aeronautics, will be an invaluable asset to Canada in the future development of aeroplanes, for which there is certain to be an increasing demand, quite independent of the duration of the war.

Depletion of Civil Ranks of Engineers

A survey of the engineering departments of our Canadian universities has demonstrated, during the past few months, that, due to war demands, the ranks of engineers are being depleted much faster than they are being recruited from the universities. As an instance, it may be mentioned that in one of our universities the present attendance in the science department is only about 15 per cent. of what it was in 1914. This state of affairs will not only be fatal to the proper prosecution of the war if it should last much longer, but it will leave us unprepared to take our part in the great engineering construction activities that must follow the cessation of hostilities.

Having this in view, your committee has considered ways and means of increasing the attendance in the engineering faculties, and in the very near future will have a definite, concrete proposition to offer. It will probably involve the expenditure of a few hundred dollars per year. How this money can be raised has not yet been determined, but, if not otherwise available, we have every confidence that the technical men of the province can be depended upon to supply the necessary funds for a cause so urgent at this moment and so much in line with our natural sympathies.

Technical Men Being Used Inefficiently

A phase of the technical situation having a direct bearing on the last item is the inefficient use that has been made of trained technical men in the past by placing them in the infantry ranks or in other war work where unskilled men would have been almost equally effective. When the present Military Service Act came into force your committee again took occasion to call the attention of the proper government authorities to this waste and to urge that engineers in future be utilized in such work as their special training best fitted them to perform.

Catalogue of Technical Books

Your committee has discussed the probable value to the average technical men of a catalogue of all the technical books to be found in the various libraries, both public and private, in Toronto and possibly including libraries in other cities. Such a catalogue exists with regard to magazines, but there is nothing of this nature covering books. The matter, as most of us are aware, has been the subject of discussion in all the various technical organizations which have representation on this committee, and has met with their approval in every case. It remains now to determine the best means of accomplishing the desired end with such assistance as we

Questionnaires

by your committee for the Advisory Council for Industrial

Research, and which was under way at our last annual meeting, has been completed. Assistance has also been given with questionnaire No. 4 to the extent of supplying the Advisory Council with our list of Ontario's technical men and in other minor matters. Your committee also assisted in the preparation of a questionnaire recently submitted by the Canadian Manufacturers' Association to their members re power shortage.

Training the Blind for Mechanical Work

It is inevitable that many of our brave fellows will return to Canada, during and after the war, afflicted with total blindness. A foretaste of this problem was seen in the recent Halifax disaster, in which so many lost their sight. It is, of course, common knowledge that in Great Britain very considerable progress has been made in training the totally blind to do mechanical work, and some progress has been made in the United States in the same direction, more notably in winding standard coils. Your committee is gathering all available information on this subject, so that it may be ready to pass along to the proper authorities. It is not entirely apparent how the practices of Great Britain and the United States can be followed or developed in Canada, where the amount of purely repetition work, such as coil winding, mentioned above, is comparatively small, but we believe the question is well worth further study.

Lists

Our original lists of technical men have been kept up to date as far as is humanly possible, and, at the present time, are undergoing a complete revision and verification. These lists have proven of the greatest value on numerous occasions, for, although it is understood that they are kept strictly confidential, we have nevertheless been able to compile from them from time to time smaller special lists for different government and war activities which, we feel quite satisfied, have repaid us all for any trouble we may have been put to in their preparation.

Vocational Training

During the early part of the year your committee was actively interested in the matter of vocational training of returned wounded soldiers, and it is with some feeling of pride that we report the selection of a member of your committee as the administrator for Canada of the vocational branch of the Military Hospitals Commission, now the Invalided Soldiers Commission. I am pleased to note that the administrator himself is with us this evening, and, as your program has already announced, will tell us of the work being done under his able organization.

Other Activities

At the time of the Halifax disaster your committee, cooperating with the Toronto Chapter of the Ontario Association of Architects, made offers of assistance in an advisory capacity to both the Commission of Conservation, Ottawa, and to the Halifax Relief Commission, Halifax. On account of the almost complete destruction of certain parts of the city it was felt there might be opportunity to rebuild at least a portion of the devastated area along predetermined lines, so as to produce something in the nature of a model city. Another matter in which we have lent our assistance is recruiting for the Canadian Engineers. I may say, also, that we have been entrusted with certain other work, about which it would not be wise to make public mention at the present time.

In Conclusion

In conclusion, I should like to add my word of appreciation of the work of the members of the joint committee, every one of whom has given freely of his time, ability and experience in the earnest hope that our little endeavor to lighten the load under which the Empire labors may not be fruitless. In this hope—that we have helped, even ever so little, to bear this burden—lies the recompense dearest to the heart of every true engineer.

Cost of Mailing vs. Hand Delivery

Majority of Central Stations Adopting the Latter Practice Since Postal Rates Increased

With the more recent increase in postage in the United States, central station companies in that country, as previously in Canada, have had to revise their methods of bill delivery. When a notice could be sent for one cent and labor was scarce and independent, the mail was usually considered more economical. Doubling the cost of postage entirely changes the complexion of matters, however, and we find that hand delivery is now being very commonly resorted to. An article in a recent issue of the Electrical World describes the policies of a number of prominent central station companies:

Not long ago—but before the postal rates went up—the Cleveland Electric Illuminating Company made an analysis of the cost of its bill delivery, which includes 60,000 bills delivered by hand and 40,000 by mail, to find out how much could be saved by using a post-card bill. The figures were found to be as shown in the acompanying table.

With the 1-cent postage rate the post-card proved to be the cheaper method, but the doubling of this cost made the hand-delivery system far more economical. The system in Cleveland has been to place the delivered bill in the consumer's mail box, or, if there is no box, to hand it to a member of the family. Failing this, the distributor brings back the bill and it is mailed. For this delivery the Cleveland company first tried boys 16 or 18 years old, but did not find them satisfactory. It then employed elderly men of from 50 to 65 years, and has practically eliminated all complaints.

In Sandusky, Ohio, however, the Sandusky Gas and Electric Company has had most satisfactory results from high school boys, who both read the meters and deliver the bills. The boys receive 1 cent per meter read. Before the postal rate went up the company used government post-cards, but since then it has devised a card of the same size, of which a six months' supply can be printed in advance. These are stamped and mailed to customers beyond the convenient reach of the delivery routes, but the bulk of them the boys deliver at a cost so far of approximately a half-cent per bill. This the company find is effecting a saving of $18 per 1,000 customers per month on postage alone, and is bringing additional economy by reducing the operating force to a minimum during the winter. Because of the limited number of hours that the students have available for this work, it is necessary to employ a much larger number than if the regular employees were handling it, but this has not proved an objection. About 9,000 bills are delivered in Sandusky between the twentieth and the last of each month.

In Mobile, Ala., the company now delivers by hand, at a cost of about 1½ cents per bill, a saving of about $37.50 a

month since the postal increase. In Traverse City, Mich., the company delivers to about 1,400 consumers, at a cost of 1 cent, and this also includes collecting about one-third of the accounts. In Pine Bluff, Ark., the company delivers 4,500 bills, using the regular meter readers after the readings are completed. It requires from four to five days, and costs in all, it is figured, from $10.50 to $12.50. In Kokomo, Ind., the company has also changed from mailing to delivery, and is distributing 6,000 bills by meter readers, at a cost of $35. In Kingston, N.Y., the meter readers now deliver 5,800 gas and electric bills, all except about 300 which are mailed to outlying territory, and the company finds the system quite as dependable as by mail. It saves approximately $50 every month. In Indianapolis the meter men of the Merchants' Heat and Light Company read meters every morning and deliver bills in the afternoon, and they have proved much more responsible than schoolboys, though boys were tried. The cost per bill now figures about 1 cent. In Denver the bills are mailed to the suburbs, but delivered in the city by boys and young men on bicycles, at a cost of one-third of a cent per bill.

In Wilkes-Barre, Pa., 19,500 bills—gas, electric, and steam heat—are delivered by two men, who receive $65 per month, delivering continuously, which means a cost of about one-half cent per bill. These men collect when possible as they deliver. In Terre Haute, Ind., the company formerly had mailed all bills at a total cost of $125 monthly, but with the higher postal rate began delivering all bills within the city by one man, who is paid $45. The remaining postage cost for bills still mailed is also $45, so that, in spite of higher postage, the company is saving $35 monthly.

On the other hand, in many outlying towns in Indiana the Indiana Railways and Light Company began with this year to try the plan of not sending any bills at all to some 2,000 customers, who are asked to call at the local offices to pay their bills, though delinquency notices are still mailed when necessary. In line with this, in Brattleboro, Vt., in Franklin, Ind., and in Seymour, Ind., the local utilities have been furnishing many customers with cards on which to make their own meter readings. This method has met with considerable success. In Fort Madison, Iowa, the meter reader in certain residence districts carries with him bills already partly made out, on which he enters the reading, making out the bill and presenting it for collection at the one call. The company's other bills go out on post-cards, and, in short, since the rates went up there has been a decided movement in the industry toward the post-card bill as offering an appropriate war-time economy.

Few Companies Using Women

All in all, however, the trend is toward delivery, if not by meter reader, then by boys or old men. One New England central station has found a practical solution by making use of the services of the substitute postmen, who, though on waiting orders, are familiar with the town and have received instructions in delivering. Everywhere the possible expedient of utilizing women for delivering has been considered, but apparently it has not been adopted very largely. However, El Reno, Okla., reports the bill delivery in charge of two young women, who are taking care of it well, and at a saving of $30 monthly on postage. At Binghamton, N.Y., girls are used to read meters and deliver bills.

Of course, the many cities where bills have always been mailed at the 2-cent rate are not affected by the postal increase. Buffalo and Wilmington, Del., state that they have no intention of changing, for they consider mailing less trouble and more sure. In Detroit, on the other hand, the company has been delivering bills by messenger for years, at a cost much less than postage, the meter readers delivering the bills. In Providence, R.I., the method is optional with the consumer in most districts. He may have it by mail or messenger, as he prefers, and bills for suburban towns are delivered to the suburban post-offices and mailed there under the local rate.

Comparison of Cost of Handling 100,000 Consumers' Bills Per Month With Special Card or Government 1-Cent Post-Card System.

Present system, printed bill in outlook envelope; 60,000 delivered by company distributors, 40,000 mailed with 2-cent stamps.

Present system:		
100,000 bills at $1.50 per 1,000	$150.00	
100,000 outlook envelopes, at $1.65 per 1,000	165.00	
40,000 2-cent stamps in rolls	802.40	
Enclosing bills in envelopes—2 boys one month at $40 each	80.00	
Sealing 100,000 envelopes and affixing 40,000 stamps, one boy one month	15.00	
*Sorting 60,000 bills for delivery, one boy one month	40.00	
*Delivering 60,000 bills, five men at $70 per month	350.00	
Supervising delivery, half time of one man at $100	50.00	
Total		$1,682.40
Proposed system:		
Special cards, 1-cent post stamp affixed:		
100,000 cards printed	$116.00	
Affixing stamps, one boy one month	45.00	
100,000 1-cent stamps, in rolls	1,006.00	
Total		1,167.00
Amount saved by using special cards and affixing stamps		$515.40
Government 1-cent post-cards:		
100,000 cards	$1,000.00	
Printing	25.84	
Total	$1,025.84	
Additional saving with government cards		141.16
Amount saved by using government stamped cards		$656.56

*Items checked indicate expense of delivering 60,000 bills per month. To find total delivery expense on 100,000 bills, add item No. 3, 40,000 2-cent stamps, $802.40.

Mr. E. H. Porte, General Manager The Renfrew Electric Manufacturing Co., Ltd., Renfrew, Ont., makers of "Canadian Beauty" household appliances. Mr. Porte leaves the Ontario Hydro-electric Commission after seven years' progressive service

Latest Information on Incandescent Lamps

By H. W. Mateer*

Mazda B lamps operate equally well in all positions. Data on the burning positions of Mazda C lamps are given in Table 1. It will be noticed from the table that Mazda C and Mazda C-2 lamps in sizes larger than 150 watts are not regularly supplied to burn in positions other than the vertical, tip down. While it is possible to modify the construction of the larger size lamps so that they will operate fairly well in positions other than tip downward, in practically all cases it will be advisable to modify the auxiliary equipment so that regular lamps may be utilized.

Color Quality of Light

The color quality of the light from a clear bulb incandescent lamp depends primarily upon the temperature of the filament. As the temperature increases, the light becomes of a whiter quality. At the temperature at which the filament of the Mazda B lamp is operated, the light has an excess of red and yellow rays when compared with average natural daylight. This characteristic has been present throughout the centuries in which lighting sources have evolved from the torch to the incandescent electric lamp. The influence on this characteristic is manifest in the red, brown, and amber tones which predominate in the decorations of rooms designed to appear at their best under artificial light. That a light of this quality is essential to the prevailing color schemes is evidenced by the frequent choice of amber colored shades. On the other hand, an artificial illuminant whose color quality is approximately the same as natural daylight is welcomed by many as opening new possibilities in interior decoration design.

The Mazda C-2 lamp has the proper screening properties incorporated in the glass of the bulb. The excess of red and yellow rays of the light are absorbed while the blue and green rays are permitted to pass through, thus a light of afternoon sunlight quality is produced at an efficiency about equal to that of the Mazda B lamp. While the color

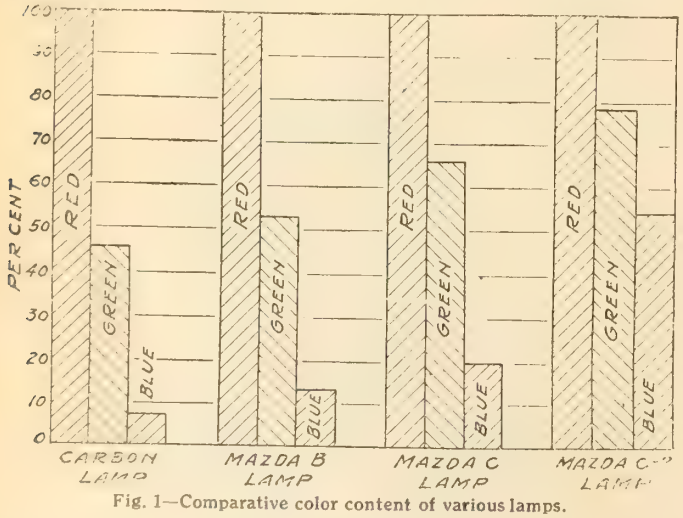

Fig. 1—Comparative color content of various lamps.

quality of such a light is sufficiently near that of daylight to serve for general illumination, and from this standpoint is a decided improvement over the light emitted by the uncolored bulb lamps, it is not of the proper quality to permit extremely accurate color matching. Where an accurate duplication of north sky light is necessary, units employing Mazda C lamps and properly designed color-screen plates should be used. The light from such units is of constant quality and therefore more dependable than the natural north sky light, which varies in quality from day to day.

The diagrams in Fig. 1 show a comparison in primary color content of the light of carbon, Mazda B, Mazda C and Mazda C-2 lamps. It will be seen that a very decided improvement in the color quality of artificial light has been effected from the time the carbon lamp was used up to the present.

Mazda B Lamps

Mazda B lamps are listed in Table 2. They are supplied in either straight-side or round bulbs for voltages of 110 to 125, and 220 to 250 volts, as indicated in the table. The efficiency ranges from 7.5 lumens per watt for the 10-watt lamp to 10.6 for the 100-watt round-bulb lamp. In practically all cases lamps should be equipped with scientifically designed reflectors, since in this way the light distribution can be controlled, and a largely increased proportion of the light be directed to the surfaces where it is desired. In all cases where the filaments are likely to be within the normal visual field, bowl-frosted lamps should be used.

Mazda C Lamps

Table 3 lists the Mazda C lamps which are designed for ordinary multiple operation. The efficiencies range from 11.5 lumens per watt for the 75-watt 110-125 volt lamp to approximately 18 lumens per watt for the 1,000-watt lamp of the same voltage class.

The filaments of all Mazda C lamps are intensely bright, and where it is at all likely that they will come within the line of vision, they should be screened from the eye. However, up to and including the 200-watt size, lamps may be used satisfactorily in open reflectors provided they are bowl-frosted. In the lighting of stores, offices and public buildings, except where semi-indirect or totally indirect lighting is employed, lamps of larger size than the 200-watt should be equipped with enclosing globes of sufficient area and of proper density to avoid the usual objectionable glare.

Mazda C-2 Lamps

Mazda C-2 lamps, as previously mentioned, employ the blue-green bulb of carefully colored glass, and are designed for general illumination where approximate daylight color quality is desired. The screening properties of the bulb are such that part of the red and yellow rays of the light from the filament are absorbed and thus the color quality of the transmitted light is that of afternoon sunlight. Obviously, the total light production is somewhat decreased by the absorption of the colored bulb. In spite of this, Mazda C-2 lamps operate with efficiencies about equal to those of Mazda B lamps. When replacing Mazda C lamps with Mazda C-2 lamps, it is necessary simply to use 50 per cent. more wattage to obtain the equivalent intensity.

Mazda C-2 lamps are furnished in sizes from 75 watts to 500 watts for voltages of 110 to 125. Additional technical data are given in Table 4.

Effect of Improvements

Since Mazda lamps were first manufactured, each new development has been accompanied by an improvement in lamp quality. Some improvements cannot be seen by the eye, others are noticeable as marked changes in construction, but all are manifest in the improved service rendered. Although improvements are continually being made, consideration is always given to making them in such a way that their advantages may be realized without the scrapping of existing equipment.

*Engineering Department, National Lamp Works of General Electric

Table No. 1—Burning Positions for Mazda C and Mazda C-2 Multiple Lamps

Lamps	For Tip Down Burning*	For Tip Up Burning	For Horizontal Burning
75-watt 100-watt 150-watt	110-125 volt	Lamps regularly supplied will burn in any position.	Lamps regularly supplied will burn in any position.
200-watt	110-125 volt 220-250 volt	Lamps regularly supplied are designed to burn in this position.	Lamps of special design furnished on special orders.
300-watt 400-watt 500-watt 750-watt 1000-watt	110-125 volt 220-250 volt	Lamps regularly supplied are designed to burn in this position.	Lamps of special design will be furnished on special orders.

Municipal Electrical Engineers Organize

Form Association Composed of Managers, Superintendents and Engineers of Ontario's Publicly Owned Utilities

The Engineering Section of the Ontario Municipal Electrical Association met in convention on March 13-14 in the Chemistry and Mining Building of the University of Toronto and, after a free discussion, decided to form a separate association. This decision took the form of a resolution, moved

Mr. E. V. Buchanan, London, President

by Mr. P. B. Yates, St. Catharines, and seconded by Mr. O. N. Perry, Windsor, which read as follows:

Form of Resolution

"That since we have been unable to effect a proper organization of Municipalities to consider operation and engineering questions of policy through the formation of the association originally laid down as an engineering branch of the Ontario Municipal Electrical Association, be it resolved that we recommend the establishment of an association of the managers, superintendents and engineers of the different Municipal Electrical Utilities free from the Ontario Municipal Electrical Association and financially independent."

The Convention then proceeded to draft a Constitution and By-laws which were considered clause by clause and adopted after discussion. The main features of the by-laws are printed below. As provided for in these by-laws, the officers are president, vice-president, secretary-treasurer and chairmen of standing committees. The elected officers for the coming year are as follows:

Officers

President, E. V. Buchanan, London, Ont.

Vice-President, E. I. Sifton, Hamilton, Ont.

Secretary, S. R. A. Clement, Hydro-electric Power Commission, Toronto, Ont.

Treasurer, R. C. McCollum, Hydro-electric Power Commission, Toronto, Ont.

Membership and Credentials Committee:—Oswald F. Scott, Belleville, Chairman; P. B. Yates, St. Catharines; J. J. Heeg, Guelph; W. E. Reesor, Lindsay; E. H. Caughell, St. Thomas.

Papers Committee:—V. S. McIntyre, Kitchener, Chairman; H. H. Couzens, Toronto; H. D. Rothwell, North Bay; F. F. Espenschied, Hydro-electric Power Commission, Toronto; L. G. Ireland, Hydro-electric Power Commission, Toronto.

Conventions Committee:—E. J. Stapleton, Collingwood, Chairman; J. E. B. Phelps, Sarnia; A. T. Hicks, Oshawa; J. McLinden, Owen Sound; O. N. Perry, Windsor.

Rules and Regulations Committee:—R. H. Martindale, Sudbury, Chairman; J. G. Archibald, Woodstock; V. B. Coleman, Port Hope; H. O. Fisk, Peterborough; T. C. James, Hydro-electric Power Commission, Toronto.

CONSTITUTION

This organization shall be known as the Association of Municipal Electrical Engineers (of Ontario), and it is organized for the following purposes, to wit:

1. To further the interests of Municipal Electrical Utili-

Mr. E. I. Sifton, Hamilton, Vice-President

Mr. S. R. A. Clement, Toronto, Secretary

Mr. R. C. McCollum, Toronto, Treasurer

Mr. R. H. Martindale, Sudbury,
Chairman Rules and Regulations Committee

Mr. V. S. McIntyre, Kitchener,
Chairman Papers Committee

Mr. E. J. Stapleton, Collingwood,
Chairman Conventions Committee

ties in Ontario and to foster closer co-operation between the Municipalities and with the parent organizations, viz.: The Hydro-electric Power Commission of Ontario and the Ontario Municipal Electrical Association.

2. For the mutual assistance of its members, education along technical and commercial lines, and the standardization of methods, apparatus and materials.

BY-LAWS

Membership

Membership in the Association shall be open to Ontario Municipal Electrical Utilities, operated locally or by the Hydro-electric Power Commission of Ontario. Each Member Utility is entitled to representation by delegates of the following active classes: Class "A," Class "B." A Class "A" delegate shall be the chief operating executive or other authorized representative of any Ontario Municipal Electrical Utility or Local Electrical Utility operated by the Hydro-electric Power Commission of Ontario, and only one such delegate from each Municipality will be permitted. The Ontario Municipal Electrical Association shall have the privilege of holding two Class "A" memberships. A Class "B" delegate shall be any other commissioner, official or employee of any Ontario Municipal Electrical Utility.

Associate Membership

Persons not eligible for either of the former two classes may be elected as Associates by a two-thirds majority vote of the Class "A" delegates present at any general meeting of the Association.

Privileges

Class "A" delegates shall be eligible for any office in the Association, and shall hold the only voting rights. The presiding officer at any meeting shall vote as a delegate, and in case of a tie shall also have the deciding vote. Class "B" delegates shall be eligible for any office in the Association other than President and Vice-president. Associates shall be eligible for any office in the Association, excepting President, Vice-President, and Chairmanship of standing committees. In all other respects the entire membership shall enjoy equal privileges, one class with another.

Officers

The officers of the Association shall be President, Vice-President, Secretary, Treasurer and Chairman of the Standing Committees. They shall each hold office, after being duly elected, for one calendar year, or until their successors are chosen, unless suspended for cause by a two-thirds majority vote of the Class "A" delegates present at any general meeting of the Association.

Meetings

Meetings shall be held from time to time; but not less than twice each calendar year, the month and place of meeting having been selected by the Association at a prior meeting. A quorum for the purpose of transacting business shall consist of a majority of the officers, and in addition Class

Mr. Oswald F. Scott, Belleville,
Chairman Membership and Credentials Committee

"A" delegates from not less than twenty per cent. of the Member Utilities. Motions shall be passed by the majority vote of all Class "A" delegates present at a legal meeting. Special meetings for specific purposes may be held at any time and place on the call of the President or on the written demand of at least 10 per cent. of the Member Utilities.

Standing Committees

The standing committees of the Association shall be as follows:—1. Membership and Credentials Committee; 2. Pa-

Electric Railways

Fast Service Line Niagara Falls to Buffalo—Operation at 600 Volts—Cost Approximates $170,000 per Mile

An article in Electric Traction by H. E. Riexinger, Chief Engineer, International Railway Company, describes a line this company is building, designed for high speed operation, between Niagara Falls and Buffalo, a distance of some twenty-three miles. The line will be operated at 600 volts, d.c. Other details are given as follows:

Overhead Construction

The overhead is of the catenary type. The messenger is 500,000 c.m. hard drawn copper cable having a 3-ft. sag between supports, spaced 200 ft. apart. The 4/0 hard drawn trolley wire having a voltage of 600 is attached to the messenger at 10 ft. spaces.

The supports for the overhead consist of steel bents and trusses spaced 200 ft. apart on tangents and varying down to 90 ft.

Four different types of steel catenary bridges have been adopted, one for use on tangents, a second for curves, a third type for strain towers, and a fourth for dead end towers at each end of the line. These catenary bridges are of unusually heavy design because of the probability of constructing additional transmission lines above this entire structure.

In all there are 420 of these catenary bridges, containing over 800 tons of structural steel.

Sub-stations

To take care of the power supply one new sub-station was built at Niagara Falls, and the existing sub-stations at Paynes Avenue and at Fillmore Avenue were changed so as to meet the demands of the new line.

At the Paynes Avenue sub-station, three 400-kw., rotary converters were taken out to provide room for three 1,000-kw. machines. The transformers, bus bar and switchboard equipment were changed to meet requirements.

At the Fillmore Avenue sub-station, one 400-kw., rotary converter was removed, and one 2,000-kw., rotary converter was installed.

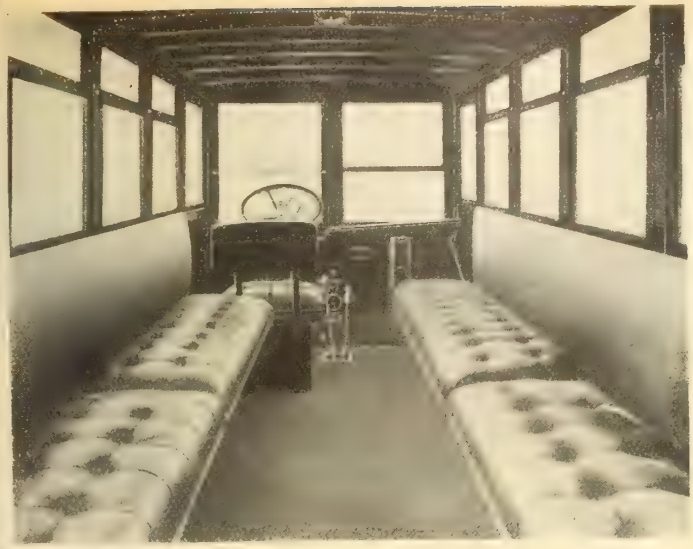
The new sub-station at Niagara Falls has two new 1,000-kw. General Electric rotary converters, and three 400-kw. rotary converters were taken from the present Niagara Falls station. Oil-cooled transformers were used instead of air-cooled because it was thought that the close proximity of the large chemical plants would make the use of air-cooled apparatus unsatisfactory.

While plans were being drawn it was not known definitely just what the incoming voltage would be at the Niagara Falls sub-station. It was finally decided to use 11,000-volt energy, but if it becomes desirable in the future to use 22,000-volt it will not be a serious problem.

The 11,000-volt equipment selected can be utilized for 22,000-volt with slight changes, the power transformers being wound for either voltage. The 35,000-volt H-3 type oil switch, double ratio current transformers, disconnect switches and bus bar material are all suitable for either voltage. If it becomes advisable to discontinue the use of 11,000-volt energy and use 22,000-volt, it will be necessary to change the connections in the power transformers and current transformers, to purchase two 22,000-110-volt potential transformers for instruments on the switchboard, and to change slightly the method of entering the building.

The actual expenditures involved by the construction of the Buffalo-Niagara Falls line will be about as follows:

Right-of-way	$ 850,000
Bridges, trestles and culverts	605,000
Sub-station equipment	111,985
Buildings	122,850
Rolling stock	225,000
Grading	508,768
Track and line labor	156,361
Track material	393,612
*Line material	474,015
Portage road subway	100,000
Engineering and interest during construction	324,759
Total	$3,872,350



*In the item for line material is included an item for a complete signal system; cost about $90,000.

Winnipeg Electric Railway Company Inaugurating Competition for Jitneys

The Winnipeg Electric Railway Company, having suffered tremendous financial hardships owing to competition of jitneys, has now decided to give the latter a taste of their own medicine. To this end a number of motor busses are being placed on the routes now operated by jitneys. Herewith are shown interior and exterior views of motor bus, which is the type adopted by the railway company. Transfers will be issued to passengers valid on street cars at points of junction. Contracts for busses were placed on March 9th.

Exterior View W. E. R. Co. Motor Bus

Motor Bus will seat 16 passengers

Each vehicle has a capacity of 16 passengers and the running schedule will be from 6 a.m. until midnight. The door has no handle and consequently passengers cannot open it to enter or leave the car while in motion. The bus is built on a one-ton truck chassis, with interior equipment similar to that of the standard street cars. Broad leather upholstered spring cushion seats, curved back rests, two dome lights, and electric push buttons are features that add to the comfort of the passengers, while the wide space between the seats gives ample room for comfort. For winter weather, heaters will be placed in the busses. There will not be any conductor; passengers will deposit their fares as they enter the bus.

Quebec Asking for Increase in Fares

Mr. W. J. Lynch, manager of the Quebec Railway, Light, Heat & Power Company, has applied to the City Council for authorization of an increase in fares on the electric railway line. He bases his application on the increase in the materials incidental to the operation of a public utility company, a list submitted showing an average increase between June, 1913, and June, 1917, of 109.3 per cent. This does not include cost of labor, which has also very substantially increased. Mr. Lynch also submitted a list of 41 street railway companies which had increased their fares between January 1st, 1917, and January 1st, 1918. The company ask for a five cent fare, 5 tickets for 25 cents, 21 tickets for a dollar; abolition of workmen's tickets; school children's tickets to remain at ten for 25 cents, but all children, excepting those in arms, to pay a three cent cash fare; transfers 1 cent cash.

M. & S. C. Building New Station

At an early date the Montreal & Southern Counties Railway Company will erect a new station, freight and general offices on Youville Street, Montreal. The building will be of three storeys and constructed of steel, concrete, and pressed brick. The present station is very small and the offices are in the Canadian Express Building, McGill Street. The company has concluded an agreement with the Montreal Tramways Company, by which a loop line will be constructed around the terminal station of the Southern Counties Railway Company, involving the crossing of the Tramways Company's lines. This will enable a more speedy handling of the cars.

Municipal Electrical Engineers Organize

(Continued from page 33.)

pers Committee; 3. Convention Committee; 4. Rules and Regulations Committee. Each Committee shall consists of a Chairman, with at least two other committee members elected by the Association at large. The Chairman of these standing committees, with the Executive officers of the Association, shall constitute the executive committee. The President is a member ex-officio of all committees.

Elections

The election of officers and standing committees shall take place at the first regular meeting in each calendar year.

The presiding officer at this meeting (President or Vice-President) shall select from the Class "A" delegates present, three men to act as a Slate or Striking Committee, who shall immediately adjourn and prepare a suggested list of officers and members of standing committees to be voted upon, at least two names being suggested for each office. Other nominations made by the meeting at large will be permitted, including the nominees of the Slate Committee. Voting shall be by ballot, and each Class "A" delegate present shall have one vote for each officer—the majority of the votes cast shall elect. A separate ballot shall be taken for each office. The new officers shall take their positions immediately after the dissolution of the general meeting at which they are elected.

Fees

An annual fee shall be assessed against each Member Utility in accordance with the following scale, based upon the number of electrical consumers at the end of the previous calendar year.

Less than 250	consumers	$2.00
251— 500	"	5.00
501— 1,000	"	7.50
1,000— 2,000	"	10.00
2,001— 3,000	"	15.00
3,001— 5,000	"	25.00
5,001—10,000	"	35.00
Over 10,000	"	50.00

Electrical Heating Publication

Of interest to everybody connected with the heating of baking, drying and japanning ovens is a reprint just issued by the Westinghouse Electric and Manufacturing Company, of East Pittsburgh, Pa. This includes an article, "Electrically Heated Japanning Ovens," by C. F. Hirshfield, reprinted from the N. E. L. A. Bulletin, and "Heat Calculation for Baking and Drying Ovens," by W. S. Scott, reprinted from the Electrical Journal. Thus there are grouped under a single cover an article giving general considerations in favor of electrical heating for this purpose and an article giving the detailed method of calculation for the amount of heat required to raise the temperature of the work, of the supporting and carrying parts, such as trucks and of the ventilating air. How to compute the losses from the external surface of the oven, and the heat required to raise the temperature of the oven walls, etc., are also given. This publication should be of much value to central station solicitors who are endeavoring to interest their customers in the electrical heating of ovens, as well as to present and prospective users of such equipment.

National Association in New Quarters

Dating from March 30, 1918, the National Association of Electrical Contractors and Dealers have permanently appointed their headquarters at Room 1703, 110 West 40th Street, New York.

The Dealer and Contractor

Magnetic Advertising—Some Basic Suggestions for the Contractor-Dealer

By F. S. Ackley*

Manufacturers and large retail establishments are able, consistent, and, hence, highly successful advertisers. Many large businesses have been built up by the publicity method. But the rank and file of small stores, particularly electrical stores, are poor advertisers, most of them doing practically no advertising worthy of the name.

Advertising does not necessarily mean buying newspaper space. That is only one feature of a well-planned campaign. In fact, many good advertisers do not use newspaper space at all and almost never run "campaigns." Advertising, in its broader sense, is serving notice on the public that you are in business in a certain line, and doing it so as to pull trade to your store. You can do this in many ways, from hanging up a sign over your door to running full pages in every newspaper in town.

Three Functions

In brief, advertising has three principal functions—to attract attention, to arouse desire, and to turn that desirer in your direction. Any publicity that does these three things well is good advertising. If a poster, a letter, a newspaper ad. or a window display gets the customers into your store it has done its part—the rest is "up to" your salesmen. They must make the sale, and the goods and the treatment accorded customers must hold the trade thus obtained.

There are two main classes of advertising—the kind that costs practically nothing and the kind that costs considerable. In the first class are store front, window displays, store arrangement, and store service. You don't have to spend any more money to give proper care to these details than to give them careless attention. Common sense and a little originality are all that is needed.

The more costly forms of advertising are newspaper, billboard, circular letters, street car publicity, and such efforts depending upon the circulation of the printed word. They are worth all they cost, but some forms are better adapted to certain businesses than others.

Let us first consider the class of advertising that requires but little expenditure—the kind that the smallest merchant should use and that the largest establishment cannot afford to neglect.

"Here I Am!"

Is your store simply one of a hundred without a thing to distinguish it from its neighbors or from the other electrical stores in town? Or does it stand out from its surroundings and say, "Here I am!" to every passerby?

A good store must have individuality. It must attract attention to itself. It must get itself known outside its immediate neighborhood. This can be accomplished by careful attention to the details of outside appearance and inside service and arrangement. Night illumination is a big factor.

If a store is to attract the attention of passers-by it should have some definite distinguishing feature. If its neighbors are dingy in appearance, fresh new paint, clean, modern windows, and a better sidewalk will accomplish the necessary. If the store is in a good business neighborhood perhaps a novel or particularly handsome sign and a different color of paint or a different shaped window will be needed. Nothing should be done to offend the eye, however, as it is favorable attention that must be attracted.

Change Often

Change the window display often and make each display interesting. Make the store arrangement inviting also. These two things will attract atention and draw trade. Make the store a bright spot at night—good illumination is a sales magnet.

Another form of publicity that does not cost the retailer anything is the leaflets that every manufacturer supplies for advertising his products. Whenever you make a sale, wrap up with the article sold a leaflet on a similar device. If you sell a washing machine, for instance, see that the customer gets flatiron or ironing machine literature. Be sure that you have price and terms marked on the leaflet. Nothing is to be gained by concealing the price, even if high. Your store arrangement can also be used to call new appliances to your customers' attention. Counter display cards and wall hangers are also valuable.

Sales Helps

Too many dealers underestimate the value of manufacturers' free sales helps. This material costs the manufacturer a great deal of money, and will sell goods if given a chance. Most manufacturers do magazine advertising also, and such advertising creates business for someone—this is a proved fact. It will bring business to you if you tie up to it by means of the good material offered you.

If you maintain a delivery auto or wagon you have another opportunity for free advertising. Posters or a painted sign on this vehicle will carry your message to every quarter of town and, if the "copy" used be properly handled, will bring in business.

The subject of advertising requires study, and such study will be well worth your while. Electrical trade papers carry, every month, excellent suggestions for publicity work. Every one of them can be adapted to your needs. Try them out—it will pay. A live dealer is always on the alert to pick up ideas and use them, and you should be able to get at least one or two business building ideas from every issue of this magazine. Success has always hinged upon the ability to take advantage of every opportnuity. These articles are intended to help you recognize such opportunities when they appear.

Spending Money

Let us now consider the forms of advertising which require an expenditure of money. Of these perhaps the commonest is newspaper advertising. The space of this article does not permit details, but the following principal rules are fundamental:

Advertise regularly. Spasmodic publicity produces at best spasmodic sales. "Keeping everlastingly at it brings

*In National Electrical Contractor.

success." If you want a steady business you must keep after it steadily.

Make your advertisements interesting and change the copy often enough to keep that interest alive. Large space is not necessary, but the "business card" form of publicity is worth very little. Classified advertisements have frequently been used with good effect.

Always use a picture in your display space. Pictures are almost certain to attract the eye. You can get good cuts free from the manufacturers of the appliances you sell.

It is best to secure a fixed place in the paper for your regular announcements, and try to use a clear type, with the balance of white space so proportioned as to give attention-attracting individuality to your advertisement. Don't crowd and don't use too small type or more than one or two sizes, and any good newspaper office will help you arrange your advertisement so as to get the best effect.

Seasonable Advertisements

Advertise seasonable things in a live way. Anything worth doing at all is worth doing well, and care spent in filling the space you have paid good money for will make the cost worth while.

Motion picture slides of seasonable subjects are also good advertising and not very costly. Manufacturers will supply you with free slides.

Closely allied to this form of publicity are posters in public places, painted sign boards, and street car cards. Practically the same rules apply to such advertising as to newspaper publicity, except that illustrations here must carry most of your message by themselves. There is little room for copy. Manufacturers supply good material for this work. and will tell you how best to use it.

Business by Mail

Advertising by mail, though costly, will, if properly done, bring big returns. Volumes have been written on this subject, and it is impossible to do more than touch upon it here.

Much depends upon your mailing list. For an electrical appliance dealer the telephone book can be used to form the basis of a pretty good list, although each name should be carefully scrutinized. Previous customers who have not bought lately are good prospects, and so are the owners or tenants of houses that you have wired. Time can profitably be spent in making up a good mailing list, as each name costs money in postage and stationery, and there should be as little waste as possible.

Having secured a good mailing list, the next thing is to plan good letters. Letters should be seasonable, sensible, and forceful. They should have a definite purpose, and should not depart for a single sentence from that purpose. Always write about what you are selling from the customer's viewpoint. If you are trying to sell a flatiron, tell the customer what it will do for her in saved steps, lighter labor, freedom from heat, etc. Then make your price and terms seem attractive to her and make it as easy as you can for her to take favorable action. If you have done all these things well and not made your letter too long, you have a good letter.

Keep careful track of all letters sent out. check returns, follow up enquiries, and record sales. You can thus tell if your attempt has been worth while, and can get data for future use.

One at a Time

Don't stuff a letter with a lot of folders. One folder on the same subject as the letter is enough. Too much literature confuses the mind of the prospect. One thing at a time accomplishes the best results in letter-writing, newspaper advertising, and most other forms of publicity.

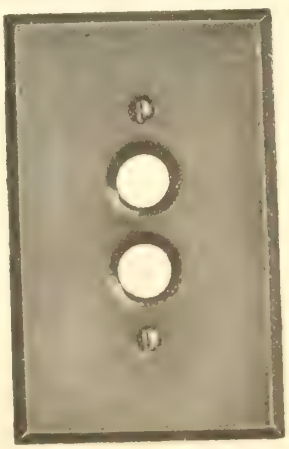
Just a word on follow-up before leaving this subject.

Don't be content with the returns you get from a single letter. At least three letters on one subject should be sent before you drop it. Keep after the prospects who have not been influenced by your first appeal—send them new arguments, new information.

Don't neglect enquiries. This is the most important part of follow-up. Poor handling of enquiries is responsible for the loss of many sales. If you can't go yourself or send a salesman, be sure you write the prospects at once a personal letter, giving all the information asked for, and, if possible, make an appointment to see the customer. Use the telephone. Keep after the prospect as long as there is any chance for a sale. If sufficient interest has been aroused to get an enquiry, there ought to be no serious obstacle between you and the sale.

Just Simple Rules

It may seem that the simple rules laid down in this article are self-evident—they are! But how often they are overlooked! Statistics show that there are 95 per cent. of failures in the business world every year—think of it! Only 5 per cent. of business men are successful. Attention to detail—intelligent application of basic principles is the road to success in any endeavor; and it has been the purpose of this and preceding articles to point out this road.

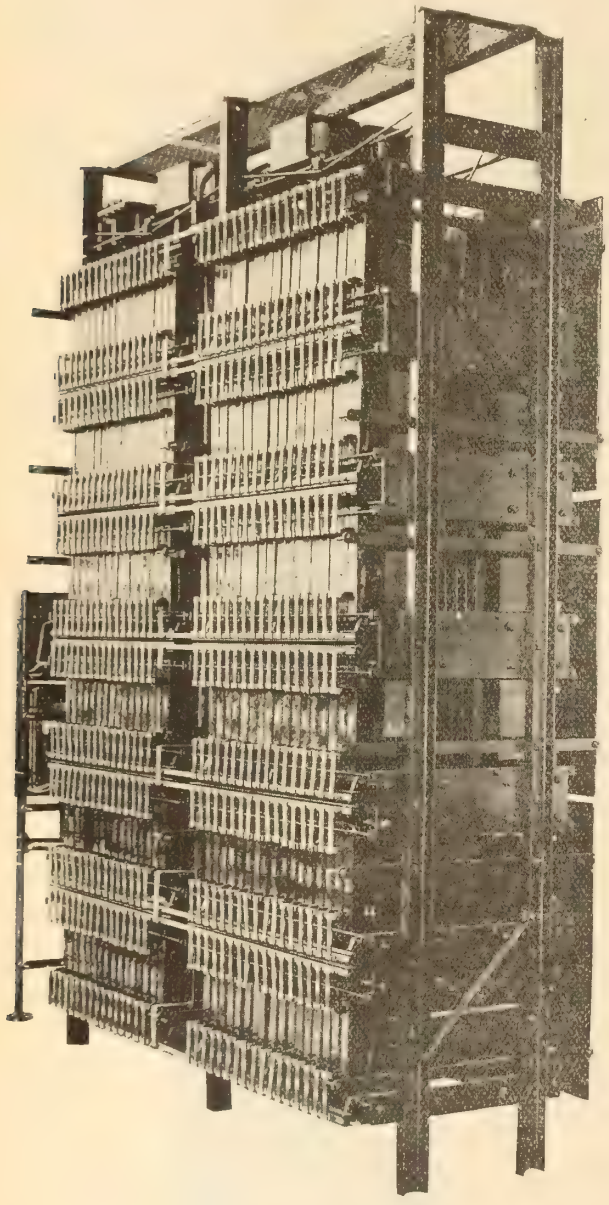


Toronto Electrical Contractors

The regular monthly meeting of the Toronto Electrical Contractors' Association will be held at the usual time and place—Walker House, 7.30—on Thursday, April 4. The president, Mr. K. A. McIntyre, will just be back from Detroit, fresh from a conference with the now famous W. L. Goodwin and other prominent members of the National Electrical Contractors' Association of the United States, and will have some interesting information to pass along.

If there's time, the discussion on accounting will be advanced a stage. There is also that matter of licensing, in which all contractors are so vitally interested. Mr. McIntyre has gathered a lot of information on this subject, too. so come prepared to express your views.

Canadian Made Switch Plates

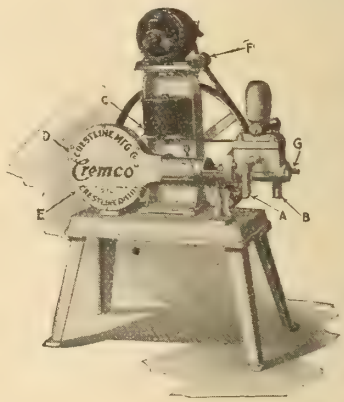


Single gang flush switch plates are now being manufactured in Canada by W. H. Banfield & Sons, Limited, Toronto.

Three styles are at present produced—blank plates, receptacle plates and No.'s 7054 and 7055 in .032 and .025 gauge. The company state they will be glad to mail samples upon request.

Static Condensers

The Canadian General Electric Company has recently developed a commercially successful type of static condenser for power factor improvement on moderate capacity feeder circuits. This static condenser consists essentially of a number of condenser sections similar to those used with generator voltage regulators. A number of improvements have been made to adapt these sections for power service, although the metal foil and paper construction is maintained. The foils and paper are assembled in oil in a metal container to increase insulating properties. In addition to the condenser sections, each equipment includes a reactance for each line leg, discharge resistance rods for each phase, a fuse in series with each cendenser section, and a switch for controlling the equipment. The static condenser has no rotating or reciprocating parts. It is connected directly across the line on which it is desired to improve the power factor.



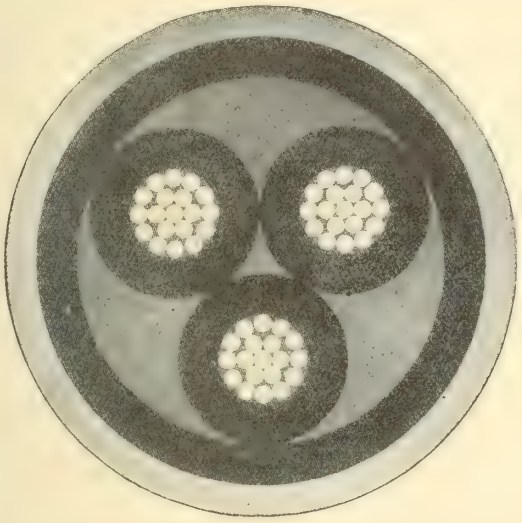
Static Condenser, 300 K.V.A., showing arrangement of Condensers

Standard equipments are controlled by an oil circuit-breaker supplied with overload trip. A low voltage release is not furnished as it is considered unnecessary to disconnect the device from the line in case the power goes off. No attendant is required to operate this condenser. To place it in operation, the control switch is closed and to remove it from service the switch is tripped open. It may be left on the line indefinitely with only an occasional inspection to see that it is operating satisfactorily. Because of this, the equipment may be installed in any out of the way space, or in a sub-station that may be inspected only monthly, or even at longer intervals. The operation is practically noiseless.

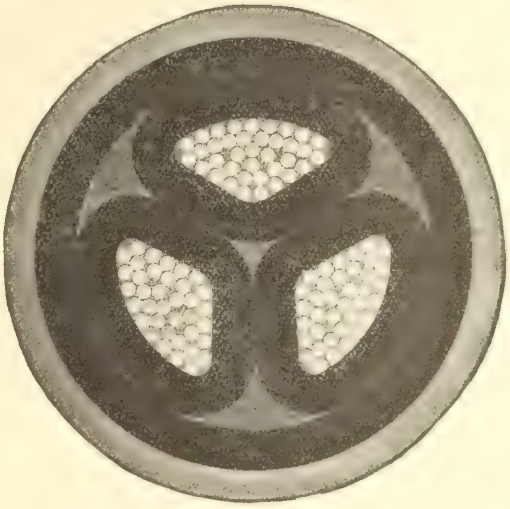
Static condensers are standard for installation on circuits ranging in frequency from 40 to 125 cycles, in voltages from 440 to 2300, and may be furnished in any capacity—though the present standards range from 50 kv.a. to 400 kv.a.

New Electrically Operated House Pump

A new small capacity electrically-driven pump has been developed by the Crestline Mfg. Company, Crestline, Ohio, which is especially suited to replace the common water lift to pump rain water for soft water in residences. It can also be used for general water supply in homes when city water supply service is not available and the pump can be placed so the suction lift will not be over 25 feet. The outfit is made in two capacities—Model "A" single cylinder with a capacity of 125 gallons per hour, and Model "B," with a capacity of 250 gallons per hour. Both will operate against a pressure of 50 pounds per square inch. An automatic controller switch is connected with the discharge and is set to



operate between pressures of 40 pound maximum and 20 pounds minimum. It can be adjusted, however, to operate at any desired pressure. The pump gears run in oil, and this same oil is automatically carried to all the pump bearings. The only oiling necessary therefore, is to place one quart of oil in the oil chamber on starting. This will be sufficient for one year's normal service. The cylinders are brass lined, have a 1½-inch bore, 3-inch stroke, and are self-primed. An air valve provides sufficient air for pneumatic pressure tank system. The valves are bronze and rest in bronze seats. The pump and motor are mounted on a cast iron base. The pump is a slow speed type which is connected to the motor by belt with idler pulley attachment. Pressure tanks are also supplied when ordered. Model "A" is fitted with a 1/6 horse-power, and Model "B" with a ¼ horse-power Robbins & Myers motor.



A Fine Lighting Scheme

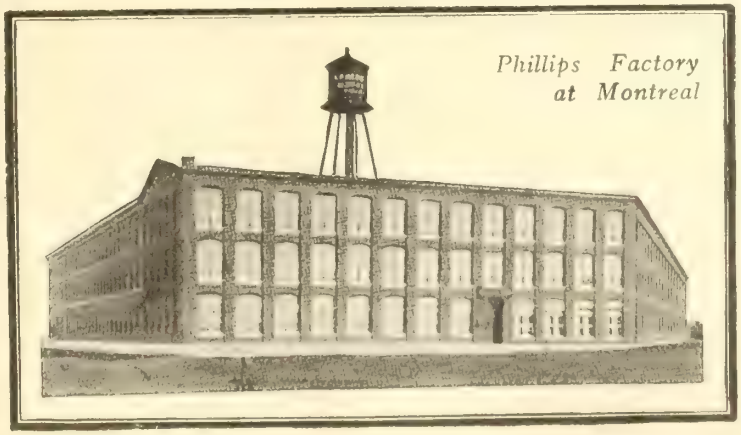
One of the most interesting features in connection with the new Toronto Art Museum, which opens its doors to the public in a few days, is the illumination. Concealed units are used throughout. These consist of "daylight" lamps, placed above a diffusing glass ceiling. The effect is a most startling approach to a real daylight illumination, both in color and intensity. The installation throughout is one of which Mr. George J. Beattie, the electrical contractor, has every reason to be proud.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Phillips Factory at Montreal

Current News and Notes

Brantford, Ont.

The annual statement of the Brantford Municipal Railways Commission shows a net deficit of $195, compared with $1,195 in the previous year. The revenue totalled $111,972, an increase of $13,834, although operating expenses have increased $12,834.

Brockville, Ont.

The Brockville Hydro-Electric Commission contemplate the installation of additional switchboards and switching equipment in order to handle additional business which it is anticipated will come from some of the large manufacturing plants likely to change over from steam to electric power.

Carleton Place, Ont.

The Hydro-Electric Power Commission of Ontario has been asked to make a valuation of the local private plant, with a view to its being purchased by the municipality and a supply of Hydro power being arranged.

Collingwood, Ont.

A 300 kv.a. synchronous condenser has been installed by the Collingwood Hydro-Electric Commission for correcting the power factor.

Cookstown, Ont.

Construction work has been started on a distribution system in Cookstown, Ont., and it is expected power will be delivered within a short time from the transmission lines of the Severn system of the Ontario Hydro-Electric Power Commission.

Drummondville, Que.

Plans are being completed by the Southern Canada Power Company for their development at Drummondville, Que., and work will be proceeded with immediately. The plant will have an ultimate capacity of 20,000 h.p., although about 10,000 h.p. will be the initial output.

Durham, Ont.

A 1,000 kv.a. frequency changer set has been installed in the plant of the National Portland Cement Company, Durham, Ont., and power will be supplied from the Eugenia system of the Hydro-Electric Power Commission.

Eugenia Falls, Ont.

Construction work in connection with the extension of the Eugenia Falls power-house of the Hydro-Electric Power Commission is progressing favorably, and it is expected that the new 4,000 h.p. unit, which is being installed, will be ready in about six weeks.

Hamilton, Ont.

The Hamilton Street Railway is being severely censured by the travelling public on account of inadequate service and antiquated rolling stock. The same public supported a large fleet of jitneys during the spring, summer, and fall months of last year, which may account, in some measure, for present deficiencies in the electric railway.

Kingston, Ont.

A 350 h.p. synchronous motor has been purchased by the Civic Utilities Commission, Kingston, for water pumping. New office and display rooms have been acquired by the commission on Princess Street.

London, Ont.

The Helena Power Company, London, has sent out notices to all customers that it might be necessary to shut down on May 1.

The figure at which the London and Lake Erie Traction Company has been offered to the city is $420,000. This is on a basis of 50 cents on the dollar of $840,000 bond issue.

Midland, Ont.

A 22,000 volt feeder from the Midland, Ont., sub-station of the Hydro-Electric Power Commission will be constructed to supply the plant of the Midland Shipbuilding Company. Three 300 kv.a. transformers, with necessary metering and protective equipment, will be installed in an outdoor sub-station. The local sub-station is also being extended and enlarged to permit the installation of an additionl bank of transformers. A 300 kv.a. synchronous condenser is also being installed in the Midland sub-station.

Ottawa, Ont.

Statistics tabled in the House of Commons recently show that in 1917 Canada had one telephone for every 13.4 persons. This compares with one to 19.3 in 1912. The total number of telephones is 604,136; number of companies, 1,659; wire mileage, 1,788,202.

Perth, Ont.

The town of Perth contemplates remodelling their street lighting and distribution system this spring, and will change over from 133 to 60 cycles.

Smith's Falls, Ont.

Work will be started in the near future on a sub-station at Smith's Falls which will supply the municipality with power purchased from the Rideau Power Company, at Merrickville, Ont.

Toronto, Ont.

Gross profits of the Canadian General Electric Company for the year 1917 show a slight decrease compared with 1916. The figures are $2,051,609 in 1917 and $2,225,912 in 1916. The cause is given as higher cost of labor and the decreased price received from munitions contracts. Dividends amounting to $780,000 have been paid, leaving a net surplus of $353,596 for the year. Hon. Frederic Nicholls, president, in his annual report, stated: "While contracts for munitions have fallen off very materially, our sales of standard machinery and supplies continue to improve." The detachment of twenty-five electrical and mechanical engineers contributed by the company for service during the continuance of the war has been, and will be, continuously maintained. In addition to contributions to the Canadian Patriotic Fund, Red Cross Society, and other war-time funds, the Canadian General Electric Company have allotted the sum of $2,297,500 to Canada's Victory War Loan.

Winnipeg, Man.

Gross earnings of the Winnipeg Electric Railway Company for 1917 were $3,339,000; operating expenses, $2,143,512. The net surplus was $92,579. It is interesting to note that, while earnings show an increase of $17,840 over 1916, operating expenses increased $204,471.

Trade Publications

C.G.E. Publications—Bulletin 68201, Drum Type Switches, CR-3900, for throwing small a.c. or d.c. motors across the line, reversing or non-reversing; Bulletin 68410, Automatic Starters for d.c. motors—current-limit-acceleration—for the automatic starting and stopping of series, shunt or compound-wound motors.

Condulet Suggestion—No. 14, by the Crouse-Hinds Company of Canada, describing how perfectly conduits and condulets are suited for use in direct motor-driven machinery. An actual installation is illustrated.

DIRECT CURRENT

1 500 KW., 550 volt, 320 R.P.M., C.P. W.D. Westinghouse 3-bearing Generator, belted to Allis-Chalmers Corliss Steam Engine; 150 lbs. steam pressure.
1 550 KW., 250 volt, 100 R.P.M., C.P. Wd., Bullock Generator, connected to 22 x 36 x 42 A.C. Co. vertical compound non-condensing engine.
1 200 KW. Triumph, 250 volt, 150 R.P.M., Russel 4-valve engine.
1 100 KW. Westinghouse, 250 volt, 250 R.P.M., straight line engine.
1 75 KW. Westinghouse, 125/250 volt, 275 R.P.M. Westinghouse Engine.
1 50 KW. Westinghouse, 125 volt, 275 R.P.M. Ideal Engine.

MOTOR GENERATOR SETS

1—300 K.W., G.E., 125/250 volt, 720 R.P.M., D.C. Gen., direct connected to one 450 H.P., 3 phase, 4000/2300 volt, 60 cycle, Ind. motor, complete with switchboard equipment.
1—150 K.W., G.E., 125/250 volt, 900 R.P.M., D.C., Gen., direct connected to suitable syn. motor, 2300 volt, 3 phase, 60 cycle, complete with switchboard equipment.
2—30 K.W., 125 volt, Westinghouse, 1140 R.P.M., D.C. Gen., direct connected to one 3 phase, 60 cycle, 220/440 Ind. motor.

SWITCHBOARD EQUIPMENT

39 3P., G.E., 35000 volt, 300 amp., form K. oil switches, either hand or solenoid operated.
11 3P., G.E., 13000 volt, H3 motor operated oil switches, 500 amp.
10—100 amp. 3P. G.E. form K., 10000 volt hand operated oil switches.
12—250 amp., 7000 volt, form K., 3P. hand operated oil switches.
10—200 amp., 4500 volt, form K., hand operated oil switches.

ALTERNATING CURRENT

1—150 K.V.A., G.E., Type A.T.B., 3 phase, 60 cycle, 480 volt, 225 R.P.M., with exciter and 16 x 18 Skinner engine
1—110 K.V.A., R. C. Co., 3 phase, 60 cycle, 240 volts, 277 R.P.M., with exciter, 14 x 15 Skinner engine.
1—105 K.V.A., G.E., Type A.T.B., 3 phase, 60 cycle, 2300 volt, 257 R.P.M. and 14 x 15 Phoenix engine.
1—75 K.V.A., F. M. Co., Type R.E., 3 phase, 60 cycle, 220 volt, 257 R.P.M., with exciter and oil engine.
1—K.V.A., Westinghouse, Type E.T., 3 phase, 60 cycle, 2200 volt, 277 R.P.M., with exciter, 12 x 12 Harrisburg engine.
1—50 K.V.A., G.E., Type A.T.B., 3 phase, 60 cycle, 220 volt, 300 R.P.M., with exciter and 11½ x 12 Ames engine.

ROTARY CONVERTERS.

1—500 K.W., 550 volt, D.C., West. Rotary Converter, 3 phase, 25 cycle, with 3 suitable S.P. transformers, 13200 volt, prim. and 390 volt sec.
4—500 K.W., 600 volt, D.C. Rotary Converters, 3 phase, 25 cycles, with suitable transformers, 6600/5940 volt prim., 430-286-143 volt sec.
1—300 K.W., 575 volt, D.C. Rotary Converter, 370 volt, A.C., 600 R.P.M., complete with 3-185 K.V.A., 60 cycle transformers, 2200 volt prim., 370 volt sec.

MISCELLANEOUS

1—200 h.p. Worthington 2 stage, 12 in. turbine pumps, rated capacity 4000 G.P.M. at 60 lbs. pressure, direct connected to one 100 h.p., 3 phase, 60 cycle, 440 volt, 575 R.P.M. Westinghouse induction motor, complete with auto starter and no voltage release.
1—1160 ft. Sullivan two-stage belt driven air compressor, complete.
1—1586 ft. Sullivan two-stage belt driven air compressor complete.
1—50 h.p. Foss Gas Engine, speed 200 R.P.M., one cylinder, flywheel 4 ft. x 12 in., used only three weeks.

A complete power plant, in first-class condition, dismantled, crated, and ready for immediate shipment, consisting of:
1—Alternator, C.G.E., 60 cycle, type T.T.B., class 48—600—1501, Form E, volt 2,200, amp. 158, speed 150, direct connected to a Rice & Sargent Providence Engineering Works 18 in. x 36 in. x 32 in. horizontal cross compound condensing engine, complete with condensers; Wainwright horizontal copper tube water-heater; switchboard, piping, and valves. Ask for further information.

WE ALSO HANDLE A FULL LINE OF ELECTRIC RAILWAY EQUIPMENT AND SUPPLIES

Our stock changes daily and above list is only a small proportion of what we have. For further particulars wire, telephone or write. Let us solve your problems. All engineering service without obligation. **We advertise and sell your released equipment without cost to you.**

Tenders Wanted for Electric Wire and Cable

Parliament Buildings, Ottawa

Sealed tenders will be received by the undersigned until noon, April 11, 1918, for the Electric Wire and Cable required in the reconstruction of the above building.

All tenders to be based on the supplying and delivering on the site of the quantities of the schedule of materials for Electric Wire and Cable in strict conformity with the specifications and the samples submitted and to the satisfaction of the Architect.

Deliveries to commence by July 1, 1918, and to continue as directed in such quantities as to ensure complete delivery by August 31, 1918.

The schedule of materials, specification and other information required can be obtained at the office of P. Lyall & Sons Construction Company, Limited, Ottawa.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Minister of Public Works, for a sum not less than ten (10 p.c.) per cent. of the amount of the tender, which will be forfeited if the parties tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender is not accepted, the cheque will be returned.

Payments for material will be made monthly.

The lowest or any tender not necessarily accepted.

Envelopes containing tenders to be marked "Tenders on Electric Wire and Cable" and addressed to the undersigned.

JOHN A. PEARSON, Architect.
J. O. MARCHAND, Associate.
Centre Block, Parliament Buildings,
Ottawa. 7-7

Generator Set Wanted

Wanted—35 to 50 K.W. 125/250 volt 3 wire D.C. Generator, direct connected to High Speed Engine. Write The Kaufman Rubber Co., Ltd., Kitchener, Ontario. 5-8

Equipment For Sale

The following electrical equipment recently taken out of commission is for sale and may be examined at Ragged Rapids Siding on C. N. O. Railway. Tenders for whole or any part will be received by Orillia W. L. & P. Commission, Orillia, Ont., up to April 10th, 1918.

No tender necessarily accepted.

A marked cheque for 20 per cent. on machinery and $500 on scrap to accompany tender. Payment to be made in full before removal.

1—600 K.V.A. Westinghouse generator, 1200 volt, 2 phase, 222 r.p.m., 36 pole, revolving field, direct coupled to waterwheel.
1—22½ K.W. Westinghouse exciter, 125 volts, direct coupled to waterwheel.
1—Generator switchboard panel, oil switch and meters.
1—Exciter panel, switches and meters.
1—300 K.V.A., S.E.C. generator, 1200 volts, 2 phase, 500 r.p.m., 16 pole, revolving field, inductor type, belt driven.
(Complete new unused armature winding).
1—70 volt, 60 ampere exciter, belt driven.
1—Samson waterwheel, 1200 h.p., 40 in. twin double runner, 33 ft. head, 222 r.p.m.
1—Samson waterwheel, 600 r.p.m., 35 h.p., 33 ft. head, single bronze runner and steel casing.
2—38 in. 3-ply leather belts, endless, 55 ft. long.
20—30 tons cast iron, bearing pedestals, bed plates, pulleys, shafting, plate and miscellaneous scrap. Brass and copper, etc.

For any further information apply to

W. K. GREENWOOD, Engineer,
7-7 Orillia, Ontario.

ECONOMY renewable FUSES

And "Drop Out" Renewal Links

Cut annual fuse maintenance costs 80%

Economy Fuses protect millions of circuits and billions of dollars' worth of machinery and property for thousands of users representing all branches of industry.

Used where safety is paramount, such as in leading powder and munitions plants, on U.S. Battleships, etc.

An inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency. No special tools or experience needed to replace the link and renew the fuse.

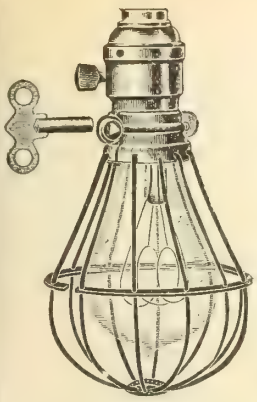
Structural Steel of all Kinds

The Ford Motor Company Uses—

Spaulding HARD FIBRE

The Ford Company uses Spaulding Hard Fibre for the purposes illustrated above because of its great mechanical strength; its electro rupture of 200 to 400 volts per 1-1000th of an inch of thickness (an insulator that will not break nor crack), and because of its adaptability, as it can be machined, sawed, punched, etc.

WRITE FOR ILLUSTRATED LITERATURE
explaining how you can save money and get better results by using Spaulding Hard Fibre in your product.



J. Spaulding & Sons Co., Tonawanda, N.Y.

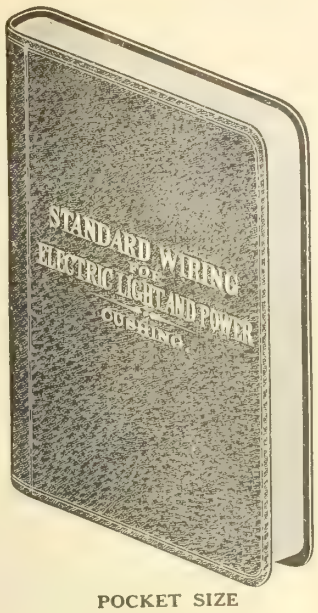
Reaching Your Customers

THE logical place and time to talk to your customers is in the Electrical News when they are thinking of things electrical.

If your product is bought by electrical men, advertising in the Electrical News will carry your message to them.

You and your wares may be favorably and nationally known to-day but if you don't advertise you will soon be forgotten.



Electrical News

Toronto

THE NATIONAL AUTHORITY FOR TWENTY-FOUR YEARS

THE 1918 EDITION

"STANDARD WIRING"

TELLS YOU HOW

POCKET SIZE
LEATHER COVER

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or for A. C. single, two or three-phase.

OUTSIDE WIRING—Pole line construction, line wires, service wires, roof structures, poles and their dimensions and weights, and how to erect and protect them and wires they carry. Insulators, guard arms, guy anchors. Tree wiring, splicing, service and entrance wiring. How to install Lightning arresters. Transformers with diagrams and instructions.

INSIDE WIRING—When and where to use rubber covered, slow burning and weatherproof wire. How to find the proper size of wire to use for lamps, motors or heating devices for any current, voltage and drop, either by formula or by the many tables that are given in this section of the book. How to wire for two-wire or three-wire systems. Direct current, two-phase and three-phase with formulae and tables, with examples worked out for each system and in a simple manner that anyone can understand and use. How to run wires on walls, ceilings, floors, through partitions and walls and in concealed places, damp places and where dangerous surroundings exist. When and where to install Switches, Cut-outs and Circuit Breakers and just how to do it. How to wire for high and low voltage systems and the precautions to be taken. The proper way to install Knife and Snap Switches, Cabinets and Cut-out Boxes, Outlet, Junction and Switch Boxes, Panel Boards, Wooden and Metal Raceways. How to install complete interior conduit jobs either for rigid metal, flexible metal or flexible non-metallic conduit. Concealed knob and tube work or armored cable. How and where to install and wire electric and combination lighting fixtures. How and where to use flexible cord and where not to use it. How to install arc lamps and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and gas filled lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination and where each should be used. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

The most complete and accurate Book on Wiring and Construction published

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

When you put a Wagner Motor to work

you are sure of continuous, dependable power as long as you want it. Is it worth anything to you to know that every motor in your shop is ready every minute to answer the call for power and to stand up even under adverse conditions?

Wagner Quality

If you want dependability you must pay for it. When you pay a preference for Wagner Motors you are assuring yourself of continuous power for years to come.

Let us send Bulletins 11013 and 11113.

OXY-ACETYLENE WELDING

A Maximum of Efficiency at a Minimum of Cost

Steel Barrel Welded by Oxy-Acetylene Process.

All the essential characteristics that tend to greatest efficiency are embodied in Oxy-Acetylene Welding. The Process is simplicity itself. The Welded joint is of practically equal strength to the Metal adjacent, absolutely airtight, leakproof, and free from future trouble, and the cost of the article produced is less than obtained by the old-fashioned methods hitherto adopted.

Undoubtedly You Can Employ the Process to Advantage in Your Industry!!

Whether you wish to join light gauge sheet metal or reclaim a broken machine part or casting weighing tons, the Oxy-Acetylene Process is the solution. The more you enquire into its possibilities, the more you will be convinced of these truths.

Our Experience is Yours for the Asking

Attach this ad. to your letter head and mail to us. We are the Pioneers of the Process with world-wide experience covering years. A staff of experts are, at your Service to instruct your representatives in the Process, to ensure its successful application to your Industry. Investigation incurs no obligation on your part.

L'Air Liquide Society

Canadian Factories: TORONTO, MONTREAL, WINNIPEG.
HALIFAX, Under Construction.

Engine manifold welded by Oxy-Acetylene Process.

LINCOLN MOTORS

Lincoln Arc Welders on the Rock Island

23 Lincoln Arc Welders are in service at the different shops of the Rock Island.

These Welders are mounted on a four-wheel truck, and can be taken any place in the shop and plugged in on any power socket where a five horse-power motor would operate.

The Lincoln Arc Welder can always be taken to the place where the locomotive is standing and welding work can go on at the same time with other repairs. Instead of moving a heavy locomotive to a special welding station, the light truck can be taken anywhere, even for a few minutes' welding work.

In addition to this advantage, the welders use the regular current distributing system in the shop, and no special low tension wire is necessary. This saves a great expense. Examination of the Lincoln Portable Welder will show that it is the most simple in construction and operation of any arc welding apparatus manufactured, still it will do everything that any outfit will do and will perform the work at lower cost.

This statement we proved in your own shop. Write for Our Engineer.

You Eliminate Needless Risk

when you install "Sterling" Rubber Insulated Wire in that building of yours. Its guarantee of safety consists of many years of unusually successful and dependable service, and in the fact that it is specified and used by architects, engineers and contractors of many buildings of international importance, one of which is shown above.

"STERLING" Rubber Insulated Wire

stands for superior quality, which means the greatest economy and durability. It exceeds National Electric Code requirements to a degree that entitles it to be considered as a separate and **higher standard** of excellence.

When in need of rubber insulated wire it will pay you to get prices of **"Sterling" Wire** before placing your order.

Our nearest office will give you complete information promptly.

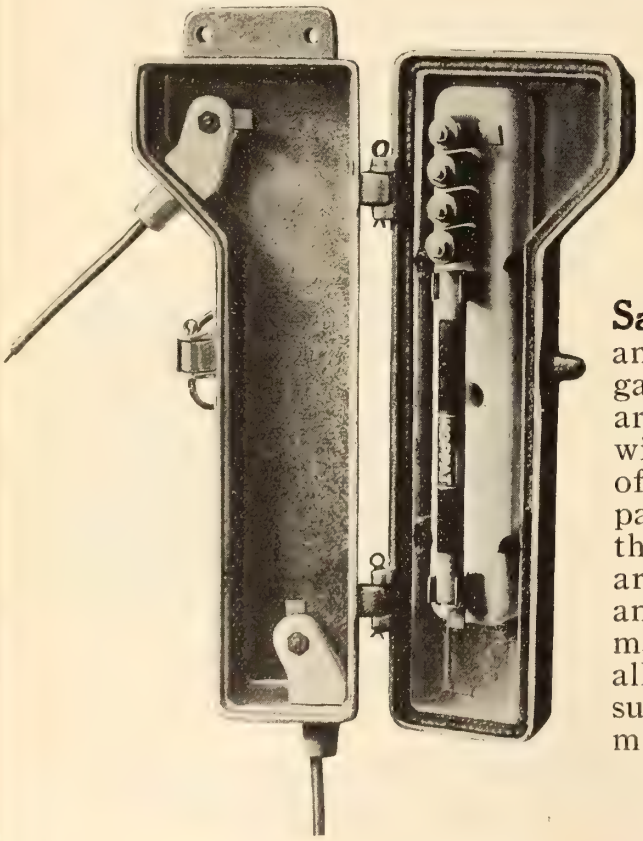
Westinghouse

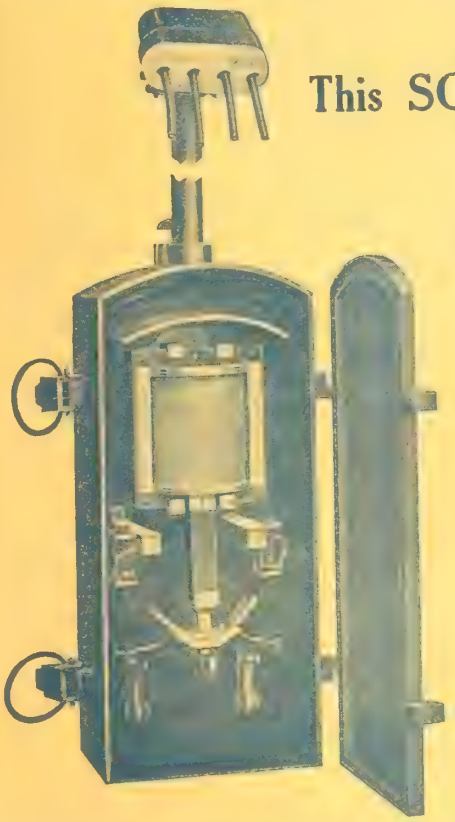


Type C R Lightning Arresters

For Unlimited Capacities, 1250 to 2500 volts

A Real "Safety First" Arrester for the protection of distributing transformers

Safety for Linemen.—When the door is open the element is dead. It can be examined, and parts replaced, without danger.



Safety for Transformers.—The multiple-gap and series resistance principle allows minimum gap possible without discharging continuously on arcing grounds. Non-arcing metal gap points will disrupt a large power current at zero point of first half-cycle, therefore, resistance is comparatively small, without danger of burning up the arrester or causing surges in the line. The arrester is easily inspected on the pole; resistance is easily replaced, and cylinder gap points may be rotated to new position, thus allowing all repairs to be made quickly on the pole, insuring arresters being in good condition with minimum inspection.

Catalogue 1-A describes the full line of Westinghouse Arresters

This SOLENOID SWITCH has been adopted by the Hydro Electric Commission

They use it for

STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

FIGURE 2—REAR

THE "S.J.B." BOX

FOR SERIES ORNAMENTAL STREET LIGHTING SYSTEMS

¶ To provide a means of disconnecting lamps from circuits supplied with current by two-conductor cable, The Northern Electric Company have recently designed the "S.J.B." Box for use on series circuits operating at potentials of 7,000 volts or less.

¶ Figs. 1 and 2 show front and rear views of the box, and Fig. 3 shows how the box is installed in the pedestal of a lamp standard. This view was taken in Montreal where all of the standards used in connection with the new lighting system are equipped with these boxes.

¶ There are many interesting features in connection with this box, but the limited space at our disposal does not permit of a detailed explanation. To those interested, however, we will be glad to send photographs and full descriptive matter on application to our nearest branch house.

LINCOLN MOTORS

Your Customers Know Them

The man you have to deal with in any industrial plant will know Lincoln Motors.

The managers and superintendents of these plants have read about Lincoln Motors in their own trade and technical papers. They know the waterproof, dust-proof insulation—the simplicity of construction—the overload capacity and the other features that make Lincoln Motor drive a paying investment.

The Lincoln advertising campaign is boosting for more motor driven plants —and more Lincoln Motors.

Speak to your customers about Lincoln Motors.

Write for Bulletin on Motors.

Some Notable Features

of the

C. & H. Poly-Phase Meters

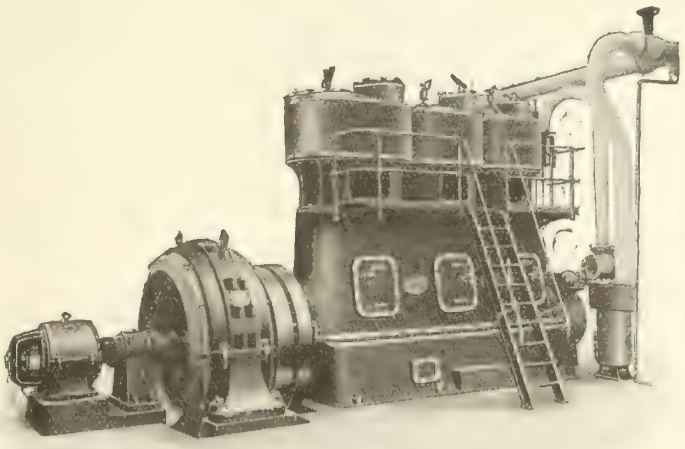
Note the following three outstanding facts.

First—the space inside the meter is greater than usual, leaving more room between the connections.

Secondly—the three or four line wires are carried direct through the Meter from left to right.

Third—Double Terminal Blocks. Experienced Electricians will readily recognise the importance of such individual features on a Meter, especially when it is subjected to heavy overloads and lightning storms.

We are building quality Meters, not price cutters



Chamberlain & Hookham Meter Co., Limited

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Have You a SEW-E-Z Motor?

The Little Labor-Saving Home Motor That Relieves You of Drudgery

THIS little Motor will sew for you without foot-pumping—will keep you cool on hot, sultry days of summer—will grind and sharpen your carving knives—will clean and polish your silverware, and perform many other household duties.

Simply place SEW-E-Z on your machine, next to the hand-wheel. No screws or bolts are needed. The little self-starter controls the speed instantly—the slightest touch of your foot makes it sew fast or slow. Always starts right, never breaks the thread. Makes sewing easy—relieves all strain—saves your health.

The fan attachment instantly changes this home labor-saver into a handsome, high-class fan that will make brighter and happier hours in your home during the hot, sultry days of summer. The grinder and buffer attachments keep your carving knives sharp and ready for use, your silver bright and shining, and give to it that pleasing lustre that adds beauty and cheerfulness to your dining-room.

Robbins & Myers Fans

JUST stand in front of a Robbins & Myers Fan this way and you'll discover a feature which has a lot to do with the popularity of the R & M Fan. You'll find that the air leaves the fan at an unusually wide angle, and that a large volume of air is moved at a velocity which is just right for real comfort.

And this large volume of air is moved by the fan without a lot of noise and fuss. The design is such that nearly all of the power of the motor is employed usefully in moving the air. Mighty little energy is wasted by the fan blades in churning the air and making a noise.

Even this little 9-inch fan will permit me to stand right up close and at the same time keep well within the cone of moving air. And you'll have to admit that some area is being covered when I'm the target.

If you will demonstrate this feature of the R & M Fan to your customers, you'll find it a big sales help.

Government Acting on Recommendations of Advisory Council

Several months ago the Advisory Council for Industrial Research made an investigation through a sub-committee, of which Mr. R. A. Ross, consulting engineer, Montreal, was chairman, of the possibility of utilizing the coal fields of Central Western Canada at other points than the immediate vicinity of the coal fields. Although the areas in this portion of Canada are almost entirely underlaid with coal, it is unfortunate that this is of a composition which deteriorates rapidly after mining, and so is not suitable for shipment to any great distance either east or west. It is doubtful if any Alberta coal, for example, has reached farther east than Winnipeg, and, therefore, it is readily seen that the Alberta coal, in its natural state, cannot be utilized to relieve the fuel shortage in what Mr. Challies designated in his recent paper before the Canadian Society of Civil Engineers as "The Acute Fuel Area," lying, roughly, east of Regina and west of Quebec.

The result of the investigations of Mr. Ross' committee showed the possibilities of briquetting this unstable coal into a more permanent form and suitable for shipment to much greater distances. As a result of these investigations, therefore, the Advisory Council made a recommendation to the government that a sum of $400,000 should be expended on the erection of a briquetting plant.

It is no secret that the members of the Advisory Council and other engineering bodies were keenly disappointed that the government did not see its way at that time to carry out these recommendations. That, however, was during the summer of 1917, and before we had experienced the acute coal situation which has existed during the past three or four months. As a result of this new experience, however, the government has now announced that they are prepared to go ahead with this plant and that the sum of $400,000 is being placed in the estimates for that purpose. There can be no doubt that in this matter they are acting most wisely and that the course they are pursuing will receive the support of all sections of the country.

Quebec Water Powers Before Montreal Electric Club

Speaking on the water-power development of Canada in relation to the fuel situation at a meeting of the Westmount Canadian Club on April 3, Mr. A. B. Beale, of the Water-Powers Branch of the Department of the Interior, urged the use of every possible substitute in order to reduce Canada's dependence on the United States for fuel. The greater use of water-power, he said, was one of the solutions of the problems, especially the generation of energy for industrial purposes, since it gave a much more economical return for the power developed than coal could possibly do. The substitution of water-power for coal would also greatly reduce the strain on transportation systems. Another advantage was that the water-power was practically unlimited, there being no diminution as the power was developed, as was the case with other sources of power.

Canada had, roughly speaking, eighteen million horse-power of hydro-electric force available within areas either already populated or likely to be so within a short time. Of this only one-tenth had as yet been developed, 75 per cent. of which was being used for municipal or other ordinary uses, 15 per cent. for pulp and paper mills, and the balance for other industries.

Practically every large centre in Canada, except some in the Middle West, was within reach of hydro-electric power, and he looked for a steady development of this source of national wealth. As to the electrification of railways, it might come later, but there would have to be a greater frequency of service, with lighter trains, to make it practical. He looked, however, for an increase in ordinary rail traffic, with a growing use of electricity for traffic purposes at terminals, and eventually an increase in the general use of electric traction.

The address was illustrated by a number of views of water-powers in the Province of Quebec, together with views of plants, transmission lines, etc.

Out of the Frying Pan Into the Fire

Apparently as a means towards mitigating the fuel shortage from which Central Canada suffered so greatly during the past winter, and which resulted not only in great personal inconvenience, but also in the shutting down of many of our vital industries, the fuel controller has seen fit to issue an order to the effect that householders and others who lay in a stock of coal for the coming winter can only purchase up to 70 per cent. of last year's requirements. As a result, when the companies are approached for an advance supply of coal, the customer is asked: "How many tons did you use last year?" If his answer is, say, "Twenty tons," he is booked for fourteen tons, and this amount will be supplied as soon as incoming shipments make its distribution possible.

It is difficult to understand what the fuel controller expects to gain by this procedure. Under the circumstances which existed last winter there were few establishments that consumed more fuel than was absolutely necessary, and in many cases a reduction of 30 per cent. would simply mean that the plants or homes will have to be closed up. If the circumstances which existed last winter, when a considerable percentage of our people had supplied themselves beforehand with their full requirements, and it remained only for the various dealers to supply the less provident proportion of

[illegible] if, under these circumstances, the supply of coal is inadequate, how much greater will the problem of supply be next winter, when there will be, in addition, the 30 per cent. of the demand of the forehanded customers also to be brought in and delivered.

It is possible the fuel controller may have argued that if the customers who usually lay in their supply beforehand are not allowed their full quota this might induce a considerable percentage of the improvident customers to buy ahead. This is very doubtful, however. The situation was sufficiently threatening last summer to induce anyone who was so inclined, or who had the ready money, to lay in such stock as he required, and it seems entirely unlikely that a greater number will avail themselves of this opportunity during the present summer. The fuel controller's order apparently, therefore, seems to mean simply this: that the dealers who in the past have urged their customers to take summer delivery because it is, so to speak, an "off peak" period, will be forced in a greater degree than ever during the present summer to keep their staff and their distribution forces in idleness.

This is, undoubtedly, the way the fuel controller's order appeals to the average person. It is also, so far as we can learn, the interpretation put upon the situation by the dealers themselves. If the controller has any other interp etation of this un-understandable order he has failed, unfortunately, to take the public into his confidence.

Professional Meeting to Discuss Fuel Situation

In this issue we are reproducing a number of papers dealing with the fuel situation, and more particularly the relation between electricity and the relief of the fuel shortage, presented before the recent professional convention of the Canadian Society of Civil Engineers, held in Toronto. Although there may have been no great amount of new information brought forward in these papers, yet the conference is notable, in that it indicated the interest professional engineers are taking in the situation, and at the same time showed that they were in possession of all the knowledge necessary to supply a solution of the difficulties under which we have labored during the past winter so far as it is available.

The conference, unfortunately, was not able to prove that electricity can compete, in dollars and cents, with coal as a source of heat supply. The figures that were given merely corroborated previous statements, that electricity must be available in very large quantities, at a price anywhere from 1/4 to 1/5c per kilowatt-hour, before electric heating will be as cheap as the present coal furnace. Not only does electric heating cost more, but there is not sufficient electric energy available to supply the general needs of the people of Canada. Immediate relief, therefore, must come from some other source, and in this respect wood was recommended as the most easily available, and, after that, peat. The latter fuel, however, could not be available until the winter of 1919, so that all the relief we can expect for the coming winter must be in the nature of a wood supply. During the conference it was announced by a representative of the Ontario Government that all provincial buildings would be supplied during the coming winter at least in so far as was possible by wood cut from Algonquin Park. What the price will be has not, of course, been determined, but it is not likely that even here, where the fuel will be obtained for nothing, that its price, laid down in Toronto, will compare with coal.

The conference was also of interest in that considerable light was thrown upon the possibilities of general electrification of railways. In this connection it was shown that while this is an end to be worked for—and, we trust, ultimately obtained—there is no immediate prospect that the coal situation can be relieved during the next two or three years by electrifying the railways of the Province of Ontario in any except isolated cases. When conditions arrive that such electrification is possible, the fuel saving, of course, on account of the inefficiency at which steam railway engines operate, will be very great.

The papers constituted a record of information which will be found of great value to readers of the Electrical News. Such as we have space for will be found in this issue, and all other papers having a direct bearing upon the relation of electricity to the fuel question will be published later.

Teach the Children That a Line Wire "Kills"

A correspondent sends the following suggestions:

"Sidney G. Booth, a boy 14 years of age, while returning from school on Wednesday, March 20, discovered, or was attracted by, the flash when a 6,000-volt wire of the Cataract Electric Company broke. He went to the wire, which was dangling in the air, and in some mysterious way he spliced a short piece of wire on to the live wire, and upon stepping from the snowbank to the ground was electrocuted.

"Would it not assist in stopping people from touching live wires if the legislature put through an act prohibiting any person from lifting a wire in his hands unless equipped with rubber gloves, or unless a stick were used in handling the wire? The public never seem to learn that they cannot let go of a live wire when once gripped by the hand unless the wire is overhead and their own weight pulls them free, or they are thrown to the ground. The public school Second Reader should contain some instructions and warnings to be taught by the teachers as a guidance to the children. Every child would be thereby warned and cautioned at the earliest possible age, and at a time when inquisitiveness begins to make an appearance. Electricity is coming into such general use, both in the cities and in the country that the death-rate from such accidents is something appalling. It is up to our legislators to do all within their power to safeguard the public, bearing in mind that the child of to-day is the man of to-morrow and the lessons taught to-day will bear fruit in after years."

There is no doubt that every possible effort should be made to educate the public that electric wires are to be avoided under any circumstances, and especially when they are dangling near the ground. It is not quite plain, however, how any act of the legislature could prevent such an accident as that recorded above. In the first place, the boy would be ignorant of the law, and, in the second place, he paid the price of his own mistake so effectively as to place him beyond the punishment of the law. The only way seems to be to train children up in the belief that a dangling wire will "kill." This being the case, the proper place to educate them seems to be in the schoolroom, as our correspondent suggests. A certain amount of education in this direction might well form a small part of the public school curriculum. Perhaps our correspondent has not seen the splendid safety pamphlets being issued by the Ontario Safety League, and which are supplied on request for distribution among the school children. These are valuable assistants in the campaign, and should be used freely, supplemented, of course, by school and home admonitions.

The contract for the dam and concrete power house of the new development of the Southern Canada Power Company on the St. Francis River at Drummondville, P.Q., has been let to Morrow & Beatty, Ltd., Peterboro. It is proposed to develop 10,000 h.p., but provision is being made in the power house for ultimate development of 18,000 h.p. The work will include about 80 miles of new transmission lines, for linking up parts of the system.

Canada's Water Powers and Their Relation to the Fuel Situation

By Mr. J. B. Challies*

The subject assigned to me in connection with this fuel-power symposium meeting of the Canadian Society of Civil Engineers is the relation of water-power to the fuel situation in Canada. At first "blush" it might appear that water-power has only an indirect and limited connection with the recent critical fuel shortage which, through suspended effort, has caused temporary industrial stagnation and local domestic hardships of enormous extent and involving great financial loss Even a casual general survey of our fuel-power requirements, however, will indicate that not only has water-power a very direct and important bearing on the present situation. but that water-power must, in the future, take a very much greater share in our fuel-power burdens.

Heat, Light, and Power Needs—One Problem

It is axiomatic that our heat, light, and power needs must be considered as one great national problem, and also that Canada's domestic and industrial development depends primarily on the co-ordinated use of all the fuel-power resources of the Dominion.

Development along independent and divergent lines has, in the past, prevented adequate correlation of the great Canadian industries of fuel production and hydro-power supply. There is now, however, as a result of the fuel shortage, developed a concensus of opinion among men familiar with fuel and hydro-power matters in Canada that there is between these allied industries enormous scope for national co-operation which would be conducive to their mutual advantage, as well as to the common weal. I propose to show:

First—That water-power must take a very prominent part if the best use of the varied fuel-power resources of Canada is to be achieved; and

Second—That there must be evolved a national master fuel-power policy which will realize the best possible co-ordinated and concomitant development and use of all the fuel-power resources of the Dominion.

Interdependence of Water-Power, Coal, Wood, Peat, Oil and Gas

Within the last two days we have had recognized experts describe the possibilities and proper functions of our different available fuels—coal, wood, peat, oil, and gas. Practically every speaker has indicated their interdependence and their interchangeability of use. It remains for me to demonstrate the relation of "white" coal to all other fuel-power agencies, and to point out that they must all "coalesce" in meeting the fuel-power requirements of the country.

To furnish a quick general summary "bird's-eye view" of the "white" and black coal situation in Canada, and to indicate their integrity I have had several maps and diagrammatic statements specially prepared for submission at this meeting.

Pacific and Atlantic Provinces Self-Sustaining, but Central Provinces Dependent for Coal

Plate No. 1 represents the coal consumption and production in Canada. The tabulated statement on the top of the

Plate No. 1—Note Acute Fuel Area.

plate summarizes the consumption in the various provinces of the different classes of coals, both domestic and imported. You will observe the greatest consumption is in Central Canada, including the Provinces of Manitoba, Ontario, and Quebec. Coal production is greatest in the extreme western and eastern provinces. British Columbia and Alberta, on the one hand, and Nova Scotia, on the other, not only meet their own coal requirements, but produce a very considerable overplus for consumption in the contiguous portions of Central Canada. The central provinces—Manitoba, Ontario, and Quebec—are almost wholly dependent on outside sources; mainly imported coals. This is clearly shown by the hatched areas on the map, the horizontal hatching covering the areas which produce their own needs, the vertical hatching covering the areas which are dependent. Where there is cross-hatching, both Canadian and imported coals are consumed. It is to be observed that Central Canada, where consumption is greatest, is non-productive. This I have termed the "acute fuel area" of Canada.

An Acute Fuel Area in Canada Largely Dependent on Imported Coal

This "acute fuel area" is now dependent for domestic requirements mainly upon Pennsylvania anthracite and for industrial needs upon Pennsylvania bituminous coals, as well as upon Canadian water-power. So far as domestic heating requirements are concerned, Mr. Dick, the consulting mining engineer of the Conservation Commission, in his paper on the "Rational Development of Canadian Coal Resources," has pointed out the possibilities of the western portion of the "acute fuel area" being furnished with briquetted lignite from the prairie provinces. Mr. Stansfield, of the Dominion Mines Branch, in his paper on "The Low Temperature Carbonization and Briquetting of Bituminous Coal." has pointed out the possibilities of meeting the domestic heating requirements of the eastern portion of the "acute fuel area" by the product from the low temperature carbonization of Nova Scotia bituminous coals. Although both these processes are proven to be practicable, they are as yet in their formative or agitational stage, and some considerable time must elapse before they can be placed on a commercial basis to furnish sufficient fuel to substitute for any large portion of the Pennsylvania anthracite now imported for domestic heating. There is at the present time no available supply, even in small quantities, of a Canadian coal fuel to take the place of imported anthracite. Nevertheless, this "acute fuel area" can eventually be made independent of foreign fuel imports, and Canada can become self-sustaining, at any rate, in respect of her domestic heating requirements. There must, as a necessary preliminary, be a national, co-ordinated development and use of all the available fuel and power-producing agencies in the Dominion. Such a co-ordination must be a matter of gradual evolution and adoption, and will, to a great extent hinge on whether Canada can reasonably expect assured fuel, imports from the United States for a considerable period in the future.

Canada an Exporter of Electrical Energy

As we are now exporting large quantities of coals from British Columbia and Nova Scotia into adjacent states of the Union, and as we are also exporting about 275,000 horsepower of electric energy, equal in value to about 3,000,000 tons of coal, it is obvious the United States cannot afford to place a sudden and complete embargo on coal exportation to Canada. The two countries must deal with each other, at least, upon a basis of quid pro quo. Providing Canada has her own fuel resources under strict national control, this power exportation should assure her an importation of sufficient coal to tide over any readjustment period necessary to permit of an ultimate dependence on Canadian sources of fuel and power.

Exportation of Electrical Energy and Assurance for Fuel Needs

The exportation in the past of Canadian electric energy has not been without compensating advantages. An assured United States market for Canadian power loads has enabled the financing and completion of several hydro-electric projects, the construction of which, so far as domestic markets alone are concerned, would not have been warranted at the time. The initial United States power load has, therefore, made it possible for the domestic market to reap all the bene-

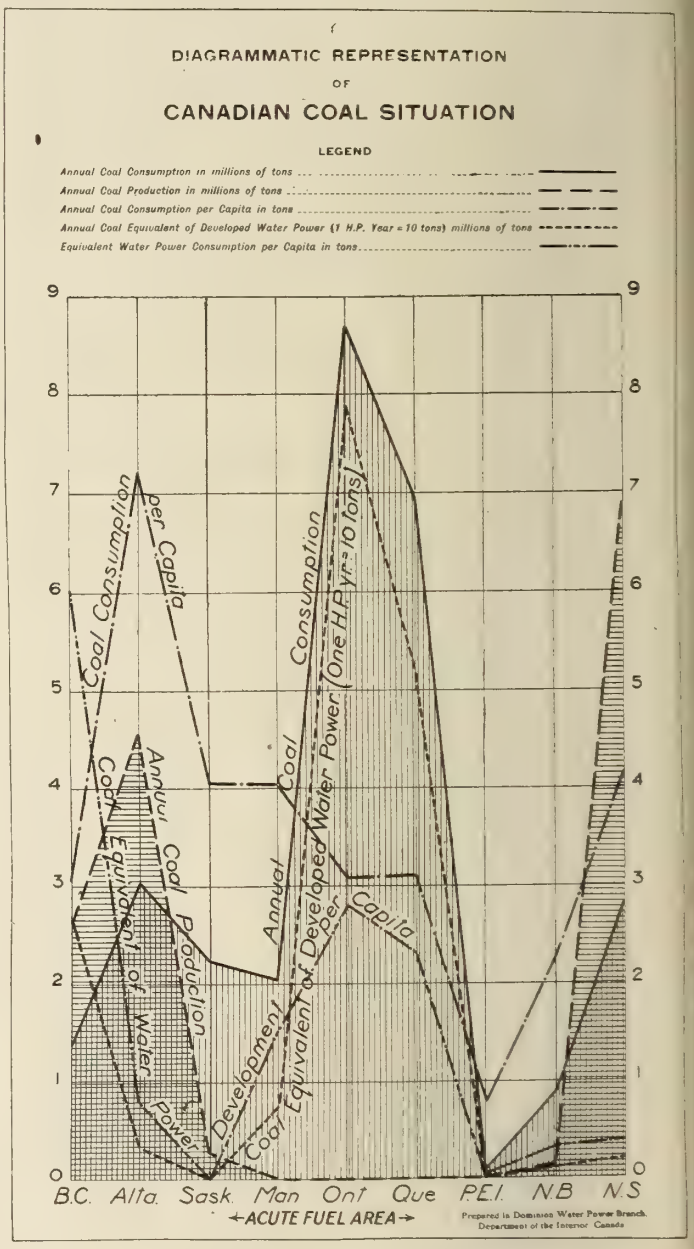

Plate No. 2—Canadian coal situation.

fits of available hydro-electric energy many years sooner than otherwise would have been possible.

While Canada has been receiving far more value in her coal importation than she has given in her power exportation, the advantage is rapidly disappearing. It is reasonble to expect that the tendency will be for hydro-power exportation to increase and for coal importation to decrease. The time may come, and in the near future, when the balance will be against Canada.

It is, therefore, imperative that every proposal for increase in the exportation of power be carefully considered from a broad, national standpoint Such consideration in-

volves the evolution of a formula with regard to power exportations which will have cognizance of Canada's fuel-power needs generally.

We must face the fact that for some time to come we shall require to import United States coal, and that in turn therefor we can, under proper conditions of recovery, safely and profitably export some of our surplus hydro-electric energy.

Canada, to Become Self-Sustaining, Must Use All Her Fuel-Power Resources According to Their Particular Adaptabiliity

Mr. B. F. Haanel, chief of the Fuel Testing Division, Department of Mines, in his clear and comprehensive paper on the "Fuels of Canada," describes the nature, location, and extent of our varied available fuel resources. Mr. Haanel affirms that, while the problems associated with the distribution of fuel to the various parts of Canada are exceedingly complex and the strictest conservation must be practised, the Dominion is endowed with fuel deposits on such a magnificent scale that all that is necessary is their proper exploitation and economic use for the country to be eventually practically independent of foreign sources of fuel. Mr. Haanel is particularly emphatic that Canada need not go abroad for fuel for household use, if her own fuel resources are properly exploited.

The problem of Canada's fuel needs outside of the "acute fuel area" offers little difficulty, owing to an abundance of both coal and water-power. It is simply a matter of efficient and effective use of available resources. Within the "acute fuel area," however, the problem is pressing and prodigious. It resolves itself into two parts—first, provision for domestic or household heating consumption; second, provision for industrial requirements.

Domestic Requirements

1. Domestic requirements of "acute fuel area" involves production of suitable substitute for anthracite.

Domestic needs involves the production of a fuel or fuels which will meet the requirements for general household use. At the present time this need is furnished by American anthracite; over 4,000,000 tons were used in 1916. Competent experts declare the anthracite coal fields of the United States are in measurable distance of exhaustion, and that the supply will not last a hundred years. Having in mind the ever-increasing demands within their own borders for this fuel, and the rapid decrease in quality as the supply becomes exhausted, responsible fuel advisers of the United States Government have seriously urged the establishment of an embargo against exportation of anthracite. We in Canada must realize that our supply of this fuel may be gradually restricted. It is, therefore, essential that we, without delay, consider what can be accomplished in the production of a suitable substitute for United States anthracite.

Industrial Requirements

2. Industrial requirements of "acute fuel area" involves (a) more efficient use of soft coal in central heating stations; (b) construction of super-power plants to serve contiguous industrial areas; (c) substitution of hydro-power for steam-produced power wherever possible; (d) use of hydro-power for all new industries wherever practicable.

The second part of the "acute fuel area" problem and the one with which water-power is most intimately connected is the fuel necessity of the industrial or manufacturing world.

The industrial requirements are now met by Canadian hydro power and United States bituminous coal—about 14,000,000 tons consumed in 1916 for this purpose in the "acute fuel area."

Owing to the large reserves of bituminous coal in Pennsylvania, this class of fuel will probably be available to the "acute fuel area" of Canada for many years. Although not immediately necessary, the ultimate substitution of bituminous coals must nevertheless be seriously considered. Water-power will be the main means of such substitution. The industrial fuel problem, therefore, in the "acute fuel area" becomes largely a matter of substitution of hydro power for fuel power.

Electrification of railways—especially terminals with adjacent engine divisions—would save enormous consumption of bituminous coal and relieve our transportation systems of their greatest burden.

It is estimated that something like 9,000,000 tons of coal was consumed by our railroads in the year 1917. Judging from the results obtained from the electrical operation of railroads in the United States, it would be possible to save at least two-thirds of this coal if electric locomotives were substituted for the present steam locomotives. This would be a saving of 6,000,000 tons of coal in one year, and would require about 900,000 water horse-power.

Electrification of steam roads at this juncture is not advocated. Under normal conditions, however, and in certain districts, as in Western Ontario, electrification will become an economic necessity in a few years.

In districts that cannot be served by water-power, the location of modern, efficient, super-power stations at strategic points, with a resultant elimination, or combination, of many

Plate No. 3—Water powers in Europe and North America—Dominion Water Power Branch estimate, slightly revised.

efficient small stations, would cause a very large saving in the consumption of soft coal, with a concurrent increased production of power.

The substitution in industry generally of hydro power for steam fuel power would also result in a tremendous relief. There are many plants where such an exchange would be possible now. Future manufacturing plants should be encouraged to locate where hydro power is available.

Water-power must be depended upon very largely to serve the industrial fuel-power situation in the "acute fuel area" of Canada.

The relation between developed water-power and the coal production and consumption in the various provinces is represented on Plate 2. It is interesting to note that in the "acute fuel area" there is about as much water-power developed, so far as coal value is concerned, as there is coal consumed. It is portentious that the bulk of our water-power production at the present time is within the "acute fuel area," and it is reassuring to know that our largest and most important potential water-powers are located within transmission range of present congested industrial districts within the "acute fuel area."

Canada Is Exceedingly Fortunate in the Extent and Location of Her Water-Powers

When considered in retrospect the production of hydro power in Canada has undoubtedly been an industrial achievement and an engineering triumph worthy our nation. In the short space of about twenty-five years there has been developed and put in use nearly 1,800,000 water horse-power. A tabulated statement (see Plate No. 3) of the water-power development in other countries, compiled recently from all available data, shows the universal importance of this resource, and indicates the splendid comparative position Canada enjoys in both potential and developed water-power. The present per capita power development in Canada is larger than all other countries except Norway. It is the same with respect to our known undeveloped water-power. No country enjoys to a greater degree the benefits of cheap dependable hydro power, and no country has had these benefits more universally applied for municipal, industrial, and domestic use. That Canada is recognized as one of the great water-power countries in the world is due largely to:

1. The nature and extent of our water resources—abundance and seasonable distribution of rainfall; the regimen of our rivers—upper waters well forested with large lakes, suitable for regulation, rivers flowing through valleys with well-concentrated falls.

2. The fortunate location of the waterfalls with respect to existing commercial centres and related raw materials.

3. The consistent endeavors of governments, Dominion and provincial, in having water-powers thoroughly investigated and intelligently administered.

4. The business acumen and foresight of the capitalist and the professional skill and courage of the engineer in blazing the trail of pioneer water-power development and use.

5. The almost universal adaptation of electric energy for municipal, industrial, and domestic purposes.

Fortunate Location of Water-Powers

The outstanding feature of the water-powers of Canada is their fortunate location with respect to existing commercial centres. Within economic transmission range of practically every important city from the Atlantic to the Pacific, except those in the Central Western prairies, there are clustered water-power sites, which will meet the probable demands for hydro power for generations. The following table, prepared by the Dominion Water-Power Branch, indicates, reasonably accurately, the provincial distribution of the developed and undeveloped water-powers within the settled portions of the Dominion:

Province.	Power available.	Power developed.
Ontario	5,800,000	789,466
Quebec	6,000,000	520,000
Nova Scotia	100,000	21,412
New Brunswick	300,000	13,390
Prince Edward Island	3,000	500
Manitoba		76,250
Saskatchewan	3,500,000	100
Alberta		32,860
British Columbia	3,000,000	269,620
Yukon	100,000	12,000
Totals	18,803,000	1.735,598

Small Portion, Not 10 Per Cent, of Canada's Available Water-Powers Developed

In general, the use of water-power in Canada may be briefly described as follows:

(a) For municipal, including domestic and ordinary in-

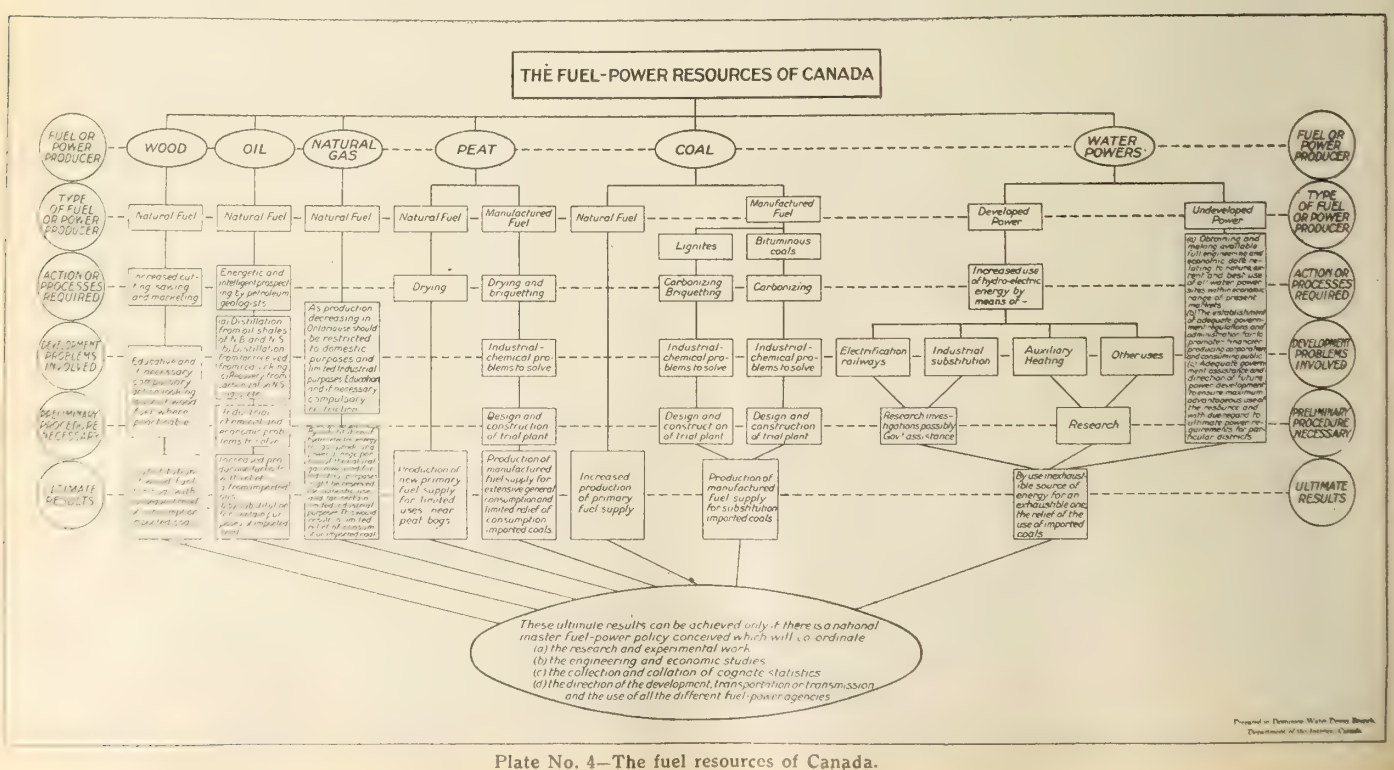

Plate No. 4—The fuel resources of Canada.

dustrial purposes, about 78 per cent. of total developed, or 1,348,490 h.p. So far as these uses are concerned, further requirements will probably be met for some years by additional installations at and increased storage for existing plants. In certain centres, however, as, for instance, the Niagara power zone, growing requirements can only be met by new water-power developments.

(b) Pulp and paper, about 14 per cent. of total developed. or 248,075 h.p. Further pulp and paper plant requirements can probably be met for some time by additional installations to present plants, although the tremendous growth of this industry will necessitate the development of new water-powers in different parts of the Dominion. There are now 54 pulp and paper plants scattered throughout Canada, and several new plants have been under serious contemplation, some of which would be in use now had it not been for the difficulty of financing, due to war conditions. On account of the isolated nature of the industry—away from commercial centres—power requirements for pulp and paper need not conflict with other demands upon hydro power.

(c) Electro-chemical and similar processes, about 8 per cent. of total developed, or 140,000 h.p. While the United States have achieved almost a world-supremacy in electro-chemistry, this industry in Canada is of very recent growth. It has, however, expanded at an enormous rate, entailing recent extensive additional installation in present plants, and requiring in the near future the development of additional water-power sites. Our propinquity to the United States and our abundance of essential raw material will compel the migration to the Dominion of many new electro-chemical plants of importance and value.

The products of the electro-chemical industry are extremely diversified. They include aluminum, silicon, calcium-carbide, cyanimid, ferro-alloys, graphite, carborundum, chlorine, etc., many of which are indispensable in the arts and in manufacture. Without aluminum the modern high-speed scout airplane would not exist; without electro-chemical abrasives and ferro-alloys manufacturing processes would be lengthened many fold.

One of the most important electro-chemical processes is the fixation of nitrogen. About 30,000 h.p. is used for this purpose at Niagara by the American Cyanamid Company, and, while other plants of this kind have so far not been put into operation commercially in this country, they have been seriously contemplated, and await only a sufficient source of low-price power for realization.

The electro-metallurgical industry is in its infancy, but promises great expansion, especially in the production of nicu-steel in Canada. Few people appreciate the rapid growth during the last few years in the use of electric furnaces for the production of the highest grades of steel.

By proper foresight the demand for hydro power for these industries need not conflict with other demands, as, for instance, municipal, domestic. and ordinary industrial uses.

Total developed power about 1,735,598 h.p.

Further Use of Hydro-Electric Power

In considering the future of water-power development in Canada it is important to note that it means the use of a non-expendiple resource, and in many cases represents the substitution of an inexhaustible resource for an exhaustible one. For this reason the use of hydro-electric energy should be encouraged in every reasonable way.

Further development of water-power in Canada will, undoubtedly, be extensive, and must depend very largely on:

1. Additional requirements for municipla, industrial, and domestic use.

2. Growth of pulp and paper industry.

3. New electro-chemical and electro-metallurgical processes.

4. Electrification of steam roads, especially terminals and adjacent engine divisions.

5. Substitution of hydro-electric power for fuel-power in manufacturing and industry.

In the rapid development within a short space of time of our water-powers to the extent of nearly 1,800,000 horse-power it is natural to expect that there has been some misconception in design. in construction, in conservation of opportunity, in overlapping of service, and even in governmental administration, although as to the latter it is an axiom in British jurisprudence that "the king can do no wrong." If we were starting de novo to develop our water-powers, with our present knowledge of what is essential in government investigation and administration, of what is really basic in conservation of resource, of the present practice of the art of hydraulic and electric engineering, and last, but by no means least, of what is the most important or prior market demand, from a national standpoint, from particular power sites, whether general municipal requirements should precede electro-chemical and allied industrial requirements, we would. for instance, most assuredly produce a very different power situation at Niagara. At the same time this most important and world-famous source of our electric energy has well served us. Generally speaking, our water-powers have undoubtedly proven to be one of Canada's most valuable assets.

Looking to the future in power development, if Canada is to reap full benefit from her heritage in white coal, there must be a constructive liaison between:

(a) The various Dominion and provincial government administrative departments concerned in water-power matters.

(b) The producing corporation or commision; and

(c) The consuming public.

Concurrently with such a liaison there must also be an adequate co-ordination of the development and use of water-power with that of all other power-producing agencies.

Anyone who has listened attentively to the very able presentation of the various elements in the fuel situation during the last two days must realize that there is a prodigious field for such co-ordination in the development and use of our varied power and heat-producing resources which will combine the effective use of all along lines for which each is best adapted, and which will, by avoiding duplication or misdirection of effort, promote the efficiency of both individual and conjoint use.

The necessity for the correlated development and use of all our fuel-power resources has surely passed the agitational or educational stage. The many urgent reasons for such correlated use are stressed a hundredfold by the coal shortage experience of this winter.

To visualize the interdependence and interrelation of all the fuel-power agencies available in Canada, and to offer something as a basis for general discussion, I have prepared a chart (Plate No. 4), which, if it indicates any one thing, it conclusively proves the immensity and complexity of the problems involved in effecting the co-ordinated, concomitant development and use of all our fuel-power resources. The chart shows that this can be best realized following the evolution of a national master fuel-power policy for all of Canada.

Gentlemen of the Canadian Society of Civil Engineers, are we going to leave this great problem in "the laps of the gods"? Is it not one of peculiar concern to engineers, and of such timely and pressing importance to Canada that we, as a society, would be warranted in attempting a solution? Should we not mark the enlargement of the scope, influence, and prestige of our society (which we hope is being exemplified by its transition to the Engineering Institute of Canada), by an earnest effort to evolve, in general terms, the basic principles of a national master fuel-power policy for Canada.

Possibilities of Lessening Fuel Consumption by the Adoption of Electrical Heating

By Mr. P. H. Mitchell*

The use of electricity in heating to lessen the fuel consumption can have very little material effect on the situation at the present moment, due mainly to the general economic limitation of available electric power and to the high cost of heating produced electrically as compared with the cost of heating by means of the common fuels.

In the future, and probably in the near future, electricity, from its possible cheapness, its possible sufficient available supply and, further, in some districts from its necessity, due to insufficient supply of combustible fuels, may assume a very important role in the heating field. It is only by electricity developed from water-power that the sufficiently low cost may be attained to make electrical heating feasible.

Canada is blessed with an abundance of water-power and, in some districts, with ample coal deposits. Nova Scotia coal is used in Nova Scotia, New Brunswick, Prince Edward Island, and Quebec; Nicola Valley and Vancouver Island coals are used in British Columbia; Crow's Nest, Lethbridge, and Edmonton coals are used in Alberta and portions of Saskatchewan and Manitoba; Ontario, practically all of Manitoba, and a small part of Quebec are dependent on United States soft coal, and United States anthracite is used over a slightly larger area.

Water-Powers Serve Districts Lacking Coal

In examining the map of Canada, having in mind the distribution of coal areas and water-power areas, it is apparent that the districts not readily served with native coal are the districts most abundantly served with water-powers. From Montreal westward to Manitoba, in the districts supplied by United States coal, the water-powers are destined to be developed to their maximums to serve the industries and utilities of the future.

It does not need much imagination to look forward, say, fifty years, a period which may be within the lifetime of a large number of us. What will be the fuel situation then? Will coal, as normally at present, be available in generous supply? Will the peat and oil sources be meeting any lack of coal? Statistics do not show a promise of this, and in the meantime, if this is "Canada's century," what is the prospect of population? An increase to 25,000,000 people by 1968, I am sure, is a figure well within the expectation of all, and Central Canada's share of this may be 15,000,000, all dwelling in the area now dependent on imported fuel.

Further, our fuel situation is so closely meshed with that of the United States that we must appreciate their viewpoint. Are two hundred millions of population in the United States in 1968 beyond a conservative estimate? Many think not, and with a fuel consumption advancing out of all proportion to increase of population, an economic limit of fuels is in sight. The prospect may result in a most drastic administration of fuels, applying these to heating purposes only, leaving to hydro-electric power all mechanical, railroad, and metallurgical operations in the endeavor to conserve the diminishing supply, and even then such a radical curtailment will only push forward the day when the substitution for fuels must be made.

The fuels of to-day are wood, coal, natural gas, peat, and oil. Of these wood and natural gas are limited for many reasons, and peat is a fuel only by extreme necessity, and as yet is not a commercially accepted probability.

*Consulting Engineer, Toronto, Ont. before Professional Meeting, C.S.C.E

It may be that some genius will conserve and redirect the vast heat transfers of nature to serve mankind, but to-day, in addition to the combustible fuels, we can only add electricity to complete the list of sources of artificial heat.

In all discussion of electrical heating there is one outstanding basis, and that is the thermal value of electricity. One kilowatt hour of electrical energy is equal to 3,413 British thermal units, or one kilowatt hour of electrical energy is capable of raising the temperature of 3,413 pounds of water one degree Fahrenheit. This heating value may be compared with that of other heating sources, and we find that, fundamentally, the ordinary heating mediums, at existing prices, are appreciably cheaper.

For instance, in the comparison of anthracite coal, bituminous coal, peat, oil fuel, and electricity we find:

Comparative B.T.U.'s for 1 Cent

Anthracite coal, in a well-built and well-regulated domestic furnace, is capable of being burned at about 55 per cent. efficiency. A good anthracite contains 13,000 B.t.u.'s per pound. At $8 per ton, 1 cent will purchase 18,000 British thermal units of heat.

Bituminous coal, when burned in a first-class mechanically-stoked boiler installation and distributed for heating purposes, is capable of about 60 per cent. overall efficiency. A good bituminous coal contains 14,000 B.t.u.'s per pound. At $3.50 per ton 1 cent will purchase 48,000 British thermal units of heat.

Peat, in briquet form, with low moisture content, in a properly-arranged furnace, should produce heat available for heating 60 per cent. efficiency on, say, 7,000 B.t.u.'s net available. The industry should be able to approach $4 per ton, so that 1 cent would purchase 21,000 British thermal units of heat.

Fuel oil may burn with 65 per cent. overall efficiency. One pound of the oil obtainable in the local market contains about 18,000 B.t.u.'s. At 7 cents per imperial gallon 1 cent will purchase 15,500 British thermal units of heat.

Electricity, when supplied to well-designed heating equipment, is capable of utilization at 100 per cent. efficiency. One kilowatt hour equals 3,413 B.t.u.'s. With electricity at 1 cent per kilowatt hour 1 cent will purchase 3,413 British thermal units of heat

Or, with electricity purchased at power rates in Ottawa or Toronto, which would average throughout twelve months at 8/10 of 1 cent per kilowatt hour, 1 cent will purchase 4,240 British thermal units of heat.

To-day fuels are more expensive than shown by the above prices, which indicate conditions at more like normal times or what we may expect after the war is over. For instance, in Toronto to-day anthracite will cost $10 per ton, bituminous coal $7.50 per ton, and fuel oil 14 cents per imperial gallon. The cost of electrical power has, unlike almost every other nameable commodity, had a downward tendency, and to-day is generally appreciably lower than before the war.

To recapitulate so that comparison of heating costs may be facilitated, and also showing fuel costs as at present, we find:

One cent will purchase of useable heat:

	B.t.u.'s.
From anthracite at $8 per ton	18,000
From anthracite at $10 per ton	14,300

From bituminous coal at $3.50 per ton	48,000
From bituminous coal at $7 per ton	24,000
From peat at $4 per ton	21,000
From fuel oil at 0.07 per gallon	15,500
From fuel oil at .14 per gallon	7,750
From electricity at 0.01 per kilowatt hour	3,413
From electricity at 0.008 per kilowatt hour	4,240

It must be born in mind that these costs and efficiencies are based on producing heated rooms in buildings, such as dwellings, and that electricity is shown used at 100 per cent. efficiency, assuming it directly applied to the room to be heated, and not affected by the unapplied waste of the other heating systems in chimney, boiler, and transmission losses.

Bituminous coal can only be used in heating plants of some magnitude, and is not suitable for dwellings except by distribution from a central steam plant. Heating by anthracite coal is the source to which electricity is to be compared.

Convenience of Electricity Offsets Extra Capital Charges

It is obvious that the cost of fuel is not the only factor in the cost of heating, but that the cost of heating equipment, attention to fires, disposal of ashes, and even. further, the extra cost of basement for heating equipment, fuel storage, and even the more or less chimneys required, are appreciable items, while fire insurance also plays a part. To go fully into all these items is quite beyond the scope of this paper, but I would propose a well-based assumption that, while the equipment for electrical heating for houses is more expensive than, say, hot air equipment, the greater annual charges against capital costs and for repairs, etc., are more than offset by the greater convenience in the handling of electricity as a heating source rather than coal.

Electricity, to seriously enter the heating field, must. instead of costing 1 cent per kilowatt hour or 1 cent for 3,413 British thermal units, approach 1/5 cent per kilowatt hour, or 1 cent for 17,065 kilowatt hours when it can economically compare with heating by anthracite coal at a fuel cost of 1 cent for 18,000 B.t.u.'s.

Let us consider an electrical heating load in detail. Assume, first, that a house, two storeys and basement, with 600 square feet area on the ground, requires as its maximum here in Toronto a demand of 12 kilowatts. We would find that the use of this throughout the year would be approximately as follows, the load factor being on the maximum demand of the year:

For two months, 12 kilowatts on average 80 per cent. load factor; for two months 12 kilowatts on average 65 per cent. load factor; for two months 12 kilowatts on average 45 per cent. load factor; for two months 12 kilowatts on average 20 per cent. load factor; for four months, 12 kilowatts on average 0 per cent. load factor.

This means a load factor of 35 per cent. over the year, or for eight months, including summer, a load factor of 16.25 per cent. The general use of electricity for heating will involve a scale of millions of horse-power. With the present heating appliances available we cannot expect plants to be built and electricity to be generated for heating purposes only, so we must consider whether we can expect the development of an elastic commercial load of such magnitude that over twelve months of the year a 65 per cent. load factor, the complement of the 35 per cent. heating load factor, can be obtained so as to provide for 24 hours per day and 365 days in the year a 100 per cent. load factor load.

Industrial Demands May Complement Heating Load

It will possibly suffice to answer this by indicating one prospective industry, the electric power demand, of which alone may readily keep pace with the future use of electric heating– that is, the manufacture of nitrogen products for fertilizers. With the depletion of natural fertility artificial fertilizers will be demanded throughout Canada. Briefly, one horse-power year will produce fertilizer for 100 acres of cultivated wheat land, so that 1,000,000 horse-power, on the 65 per cent. load factor available, would produce fertilizer for 100,000 square miles. There is no question of our complete dependence on manufactured nitrates in the not far distant future and on a scale which involves millions of horse-power.

Or it may be that the demand for electrical heating will be such that this load will be of primary importance itself, and the future form of heating equipment by which electrical heating will be accomplished may be, of necessity, radically different from the present-day devices to meet the requirements. Economical heating apparatus will undoubtedly be of the heat-storing type, so as to take advantage of the power available on the off-peak periods. These may use masses of high specific heat materials, or even steam reservoirs, in which to store and liberate heat over a 24-hour cycle; and, further, the 24-hour use of electricity may be arranged to meet only the average conditions, the surplus available during below-average periods being used for the manufacture of fuels, such as hydrogen, to be stored for use in the above average periods, thus providing a continuous electrical heating load over a yearly cycle.

The combination of the maximum developments of many of our great power sites should, when the non-heating load period has been organized to use power along other lines. or when a continuous heating load on a yearly cycle is established, readily make power available for electric heating purposes at an equivalent cost of less than $12 per horse-power year delivered in districts even remote from the generating source. Then the rate for heating purposes would be below .2 cents per kilowatt hour, or 1 cent would purchase over 18,000 British thermal units of applied heat. Electricity then, if available in the necessary quantities, would readily become the foremost source of artificial heat.

The use of electricity for many of the other domestic uses for heat, such as for cooking, water heating, etc., is well established, and forms no mean portion of the present electrical loads.

Power Development May Exceed Present Estimates

Now, when we speak of millions of horse-power and our possible future dependence on a general use of electrical heating in Central Canada are we justified in anticipating that such enormous quantities of power will be available

The latest comprehensive compilation of water-power resources in Canada gives a total of about 18,000,000 horse-power available in the 2.000,000 of the 3,729,700 square miles of Canada's area which may be expected to be fairly thickly populated within the next few decades. It is stipulated for this figure that it is "inclusive in the case of Niagara Falls. Fort Frances, and the St. Mary's River at Sault Ste. Marie. of only the development permitted by international treaties. and, further, does not contemplate the full possibilities of storage for the improvement of capacities." The effect of such a restriction in the compilation of the totals of the water-power resources may be indicated by the available power on the Canadian side at Niagara Falls when developed to a maximum, being over 2,000,000 horse-power, while less than 500,000 horse-power is permitted by agreements, the restrictions being practically dictated by the desire to retain the scenic beauty of the falls. Again, practically all the water-powers of Ontario on the Great Lakes and James Bay sides of the height of land are quite dependent on storage, so that, instead of some 5,500,000 horse-power being listed as Ontario's portion, 12,000,000 here alone would more likely represent the possible development that the future may see. and it may be that, instead of 17,820,000 horse power in the

southerly half of Canada, 35,000,000 horse-power may be produced.

The present enormous use of electric power really had its inception 25 years ago, when electric power was first transmitted from Niagara Falls, N.Y., to Buffalo, while in Canada, in the last 12 years, the demand has jumped from about zero to the astounding figures of the present. To-day, while there are 409,000 horse-power generated at Niagara Falls, there is a serious power shortage, and the power-users are feverishly awaiting further developments of hundreds of thousands of horse-power at this source. If since 1905, and more particularly just within the last few years, the power demand has grown so rapidly, what will fifty years from now see? Possibly it will then be a scarcity of sites to develop, and all may be interconnected into a vast network of transmission and distributing lines, all the sources combining to obtain the maximum of energy from the widely-distributed water-falls.

Eectric Heating Feasible at $12 Per H.P.

In conclusion, I would briefly summarize as follows:

1. Electric heating is not a present economic possibility, due to high cost and lack of available power.

2. Electric power rates would have to be one-quarter of the present rates for electric heating to compete with heating by anthracite coal.

3. Many millions of horse-power would be required to meet even present requirements. For example, I would estimate a demand of 2,000,000 horse-power to heat Toronto's dwellings and other buildings, or 4 horse-power per person of population.

4. When millions of horse-power in Canada are developed and, say, delivered $12 power is attained, a large electric heating load may be established. This, of course, does not mean that every portion of the country could be served, but areas representing the great bulk of the population would be in the zones of distribution from such powers, and it might thus be possible to greatly substitute for coal and other fuels.

5. It may be that the economic future of our fuel and water-power resources will demand that in their administration fuels will be reserved for heating purposes and that the hydro-electric power available will be substituted to the maximum for all mechanical, railroad, and metallurgical operations.

6. By the use of devices for heat storing and fuel manufacturing, in combined or separate installations, so as to use throughout the yearly cycle a continuous heating load of 100 per cent. load factor, but of average rather than of peak demand, electric heating might be given a positively economic status, or, further the development of loads in millions of horse-power equalling in demand the electric power required for heating, yet elastic enough in its use to adapt to the low load periods of heating, may again suffice to make electrical heating of economic importance.

Discussion on Electric Heating

By Mr. H. G. Acres*

The four papers we have just heard cover such a vast field and furnish such limitless opportunities for discussion and conjuncture that it is impossible to touch on more than one or two of the many points which are worth enlarging upon. In the first place I wish to consider, briefly, a matter alluded to by Mr. Challies and dealt with more at length by Mr. Mitchell; namely, house heating by electricity. Mr. Mitchell has very ably elucidated some points with reference to the feasibility of heating buildings, which perhaps are not generally appreciated, and it might be interesting to enlarge upon some of his conclusions with special reference to the problem of heating the city of Toronto with Niagara power.

First, as to cost—What fundamental condition accounts for the fact that a house in Toronto can be more cheaply heated by means of Pennsylvania coal than by Niagara power, supplied at actual cost? To work this out let us first take one kw. of potential heat from the falling waters of Niagara. Under peak load conditions, there will be 85 per cent. of this unit of heat left when it has passed through the turbine; 80 per cent. when it has passed through the generator; 76 per cent. when it has passed through the step-up transformer; possibly not more than 66 per cent. when it has passed over the transmission line; 62 per cent. when it has passed through the step-down transformer; 57 per cent. when it has passed through the local distribution system and 52 per cent. when it has passed through the service transformer. In other words, about one-half of this unit of heat would be left for effective use as heat on the premises of the consumer.

Then take a pound of coal from a Pennsylvania mine—the whole of this pound is delivered to the consumer's premises. It contains about 2 kw. hours of effective potential heat for which you pay ½ cent on the basis of present price of coal, or ¼ cent for 1 kw. hour, as against 9/10ths of a cent for the kw. hour of heat from Niagara, on the basis of present rates.

Six Steps in Converting Niagara Energy for Heat

This kilowatt of potential heat from Niagara undergoes six distinct steps of conversion before it is delivered on the consumer's premises as heat. The potential heat of the Pennsylvania coal undergoes one conversion only before being put to its ultimate use. The efficiency of conversion from the natural state to ultimate use is probably about the same, but in one case you require a power plant, a step-up transformer; 80 miles of transmission line; a step-down transformer; a distribution system and a service transformer. In the other you require a $200 furnace and a 50 cent shovel. These two conditions relative to the delivery of the commodity must be considered as having a more or less fixed influence on comparative costs, and the only factors which will tend to any appreciable extent to reconcile the present disparity will be an enormous increase in the price of coal, or a compensating reduction in the cost of electric power, assuming, of course, that both commodities will be available for the use under discussion, which is another question altogether.

Then as to service conditions—I think there are about 80,000 buildings in the city of Toronto. It is safe to say that during the extreme weather last winter coal was being burnt in these buildings, for a day or two at a time, at an average rate of four tons per month, or, say, for a two-day period, on several occasions, an average of 270 pounds of coal was burnt in each building in the city. I think that is well on the conservative side. On the basis of this assumption it would require over 1,500,000 horse-power of station capacity at Niagara to heat Toronto in zero weather. Furthermore, on the basis of Mr. Mitchell's estimates of load factor, for two months only 65 per cent. of this power would be used, for two months only 45 per cent., for two months only 20 per cent., and for four months none would be used at all. This is a service condition which is absolutely unheard of at the present time. Under such circumstances an extraordinary operating condition would obtain, in that the load-factor on the generating plant would be mainly controlled by the direction of the wind. On several occasions last winter the rise in temperature due to changing wind direction might have pulled half a million kw. off the station busses over night. Mr. Mitchell has suggested a solution of this load-factor problem as far as the generating plant is concerned, but even granting that industries could be es-

*Hydraulic Engineer, Ontario Hydro-Electric Commission.

tablished at Niagara which could economically absorb these enormous quantities of off-peak power, it would not help Toronto, with over 1,000,000 h.p. of installed transformer capacity operating at 35 per cent. load-factor, together with the necessary transmission line capacity to Niagara Falls.

Market Will Develop for Off-Peak Power

In submitting these very approximate figures, I have, of course, not considered the matter of off-peak power. If the price of coal holds at the present figure, or tends to increase, there is undoubtedly a commercial possibility of using electric power as an auxiliary heating medium during off-peak hours, and a rate for this class of service could possibly be fixed sufficiently low to attract some consumers. This phase of the question cannot, however, be discussed very intelligently except at considerable length and on an essentially technical basis.

I may say here that the hypothetical service condition I have just described is one which is certain to obtain in the future at Niagara and at other large hydro-electric power centres, though in a much less acute form. The time is not far distant when the scarcity of power in what Mr. Challies has called the "acute fuel area" will revolutionize the present conditions and rules of service, and a certain class of consumers will develop who will be glad enough to make use, not only of all available off-peak power, but also to take advantage of such power as may be intermittently available during higher stages of flow. Those having to do with the development of hydro-electric power should, therefore, bear in mind that it is only a question of time when the scarcity of fuel and the approaching ultimate exhaustion of hydraulic power resources will make the production of intermittent power not only profitable, but necessary for the public welfare, and permanent works at least should be designed against such a contingency.

Now referring again to Mr. Challies' paper, I think the most important and significant section of the same is that which considers the use of Canada's fuel-power resources according to their adaptability. In considering this phase of the problem we are rather on the horns of a dilemma. Should we consider the advisability or possibility of moving out of the "acute fuel area" such industries as are mainly dependent on coal as a raw material or as a source of power, and of replacing them by industries mainly dependent on water-generated power, or should we look after these industries as best we can by centralized heating plants and out of our future allotments of imported coal? In other words, should the problem of adaptability be attacked on the basis of adapting our fuel power resources to industry as now existing and located, or on the basis of adapting industry to our fuel power resources?

Large Industries May Absorb Excessive Amount of Power

I have in mind one instance which will serve as an illustration of the working of the latter alternative; that is, adapting an industry to our fuel-power resources. Cyanamid, calcium carbide and carborundum are made by processes requiring large quantities of cheap power. They also require large quantities of carbonaceous material which is now supplied in the form of coke made from Pennsylvania coal. There are two points to be considered in connection with this proposition, the most evident being, of course, the necessity of importing coal for such of these industries as are located in the "acute fuel areas." The other point is that the uncontrolled expansion of such industries as these in the vicinity of our large boundary water powers will in the near future absorb capacity that at a slightly more remote period may be urgently needed to keep alive a multiplicity of small industries scattered throughout the territory which is within transmission distance of these sources of power. For unlimited development of large local industries in the vicinity of our large boundary water powers is, therefore, a possible condition of the future which would seem to be undesirable. As against the possibility of such a situation developing in the "acute fuel area" we have, for instance, the Nelson River, a virgin field for hydraulic power exploitation furnishing unrivalled opportunity for the appropriate and efficient location of industry. Three million horsepower of commercially utilizable energy, all more or less accessible to the Hudson Bay Railway, and lying on the very threshold of the Empire's granary. Two million horsepower of this capacity would supply sufficient fertilizer for the whole of the northwest wheat area. Nitrogen and limestone are locally available, and the only important ingredient lacking is carbon. Whether this lack can be made good by western lignite I do not know. That is part of the problem. Crow's Nest coal and Welsh coal, via Port Nelson, would, of course, be available at a price. Here is a problem which is directly in line with the all-important issue under discussion at this meeting, and one which, if intensively studied, would at least serve the purpose of establishing certain fundamental laws which should govern the use of our fuel power resources in relation to their peculiar adaptability. A co-related phase of this study would be to ascertain to what degree the use of the water-powers in the "acute fuel area," more particularly the boundary water-powers, should be controlled so as to preserve an equitable balance between the amounts of power allotted to large local electro-chemical and electro-thermal industries and the amounts of power required, or likely to be required, for general distribution purposes. As a general rule the industrial centres immediately adjacent to the developed power sites will be the first to benefit, but the inevitable result of industrial expansion will be to include more and more of the surrounding territory within the zones of influence of these sources of power, and it is supremely important that these zones shall expand freely along economic lines and not be forced into unnatural channels by private interest or other influences which should have no prior status in the control of a national asset of such magnitude as our water powers.

True Glory of Niagara is its Potentiality

Now, before closing, I would like to mention another matter more or less directly related to the issue under discussion, and which has been briefly referred to by Mr. Mitchell. Probably 90 per cent. of the civilized inhabitants of this planet know Niagara only as a scenic spectacle. Most of them have nevertheless felt the commercial influence of Niagara without realizing it. Their first-hand knowledge of the world's most important water power has, however, been derived chiefly from picture post cards. Since power was first developed at Niagara Falls a continuous campaign of opposition to the commercial exploitation of Niagara has been carried on, based on aesthetic grounds. This opposition has left its mark on legislation on both sides of the line and on the Boundary Waters Treaty. As a matter of fact it is largely responsible for the present shortage of power.

The term "commercial exploitation" may sound cold blooded, but we may as well call a spade a spade, and anyway, in my opinion, the true glory of Niagara lies not in the roar and the rainbows, but in the vast potentiality of the falling waters, considered in the light of an instrument placed in our hands by a Divine Providence for a beneficent purpose, or, as Sir Adam Beck expressed it eight years ago, "to raise the scale of living of our citizens, and to multiply and cheapen the comforts of life." Niagara can have no greater destiny than this, and while aesthetic opposition to the commercial exploitation of Niagara must ultimately fade in the face of these more pressing issues, I think the process should be accelerated as much as possible.

The Dealer and Contractor

Further Light on the Goodwin Plan of Organization—No Price Fixing Planned—Quantity Will Always be a Factor—Educate the Curbstone Contractor

Speaking before the Illinois Contractors' Association recently on his merchandising plan, Mr. W. L. Goodwin said:

"Some people have been saying that I have an ulterior motive in assisting to organize a better contractor-dealers' association. I tell you frankly, gentlemen, that I have an ulterior motive. And I'll tell you what it is.

"I believe the electrical industry has a greater responsibility than any other single industry in the extent to which it can serve the public with both their necessities and conveniences. Hence the business is capable of great expansion. I believe it can be made the foremost of our industries, and that is the purpose of developing a thorough organization.

"I want to see it develop its ability to serve the public until its annual sales amount to $30 or more per capita of the population—instead of $7 per capita as it is to-day. That's my ulterior motive!"

Question-Box Was Feature

At this meeting the question box was a prominent feature. Everyone was invited to put any questions concerning the plan in the box, and was assured that the questions would be answered by Mr. Goodwin. It was not even necessary for the enquirer to sign his name to the questions. When the box was opened there were 62 questions in it. Here are some of the more important questions and the answers as given by Mr. Goodwin:

Q.—You said the average jobber's overhead was about 15 per cent. and that that figure was too high. What should it be?

A.—The jobber's overhead should not exceed the cost to the manufacturer of doing the same work. That might be more than 15 per cent. on some specialties, but it certainly would be less than 15 per cent. on certain staple products. The jobber at the present time lumps his overhead when he ought to figure the cost of warehousing and handling on different lines according to what the cost of warehousing and handling is.

Q.—Does your plan contemplate dealing with labor

A.—The plan does not contemplate dealing with labor in any phase.

Q.—Should not association secretaries furnish members with data on cost of operating electrical appliances?

A.—It would be a good idea for the national association to get out a sheet for the data book showing the average cost of operation of all of the principal electrical appliances.

Q.—Where do the fixture people come in under the Goodwin plan?

A.—The manufacturers belong in the fixture section of the Associated Manufacturers of Electrical Supplies. The retailers of fixtures whose problem is a retail problem should be a part of the National Association of Electrical Contractors and Dealers, where identical problems are discussed.

Q.—Does the plan contemplate abolishing schedules based on quantity purchases

A.—I believe that quantity will always control price. There is nothing in the plan that contemplates price fixing. It is believed that the plan will standardize rates of profit.

Q.—Will the Goodwin plan teach contractors the fundamentals of electricity

A.—The plan does not contemplate developing in the contractor a knowledge of electricity. He is supposed to have that knowledge. But it does propose to teach him merchandising methods.

Q.—What will happen to the manufacturers' agents if the Goodwin plan succeeds

A.—There is a place in the plan and in the industry for the manufacturer's agent. If he is a real manufacturer's agent he stands at the same place on the Wheatstone Bridge diagram as the manufacturer stands.

Q.—How can this merchandising movement help the man who cannot leave his store to attend the meetings,

A.—In California there were a few retailers who, when this movement was first started, could not leave their places of business to attend the meetings. To overcome this difficulty some of the jobbers sent their salesmen out to run the stores of these men while they attended the meeting, and it was not long before these merchants were doing enough business so that they could afford to leave their store to attend the association's activities.

Q.—What can be done with the curbstone contractor?

A.—The curbstone contractor must be educated. The best person to educate him is the jobber. The jobber should send his bookkeeper to the curbstoner and show him what overhead is. Such education will do much for him.

Q.—Under what classification would you place a railroad company?

A.—The railroad is a public utility company, and should be recognized as a trade buyer.

Q.—Is the Goodwin plan legal?

A.—The plan is not in restraint of trade according to the best legal advice I can get.

Q.—Does the plan encourage time and material work?

A.—The Goodwin plan encourages the contractor to take work on the time-and-material basis, because that is a basis which is economically sound and, in the long run, is cheaper for the consumer.

Q.—Is the central station eligible to membership in the contractors' association?

A.—If the central station conducts a retail business it is eligible to membership, and its dues would be based upon the amount of retail merchandising business which it does. Any retailer of electrical merchandise is eligible to membership.

The annual report of the Department of Telephones of the Province of Saskatchewan for the financial year ended April 30, 1917, is just received. The total number of stations in the province is now 43,993, made up of 18,669 government stations, 23,813 rural stations, and 1,511 other systems. The number of long distance pole miles is now 3,275, and long distance wire miles 18,833.

Increasing a Central Station Power Load

Where Energy is Available the Summer Offers Big Opportunities— The Contractor Should Co-operate and Profit

Though certain sections of the Dominion suffer from a shortage of electric power, the city of Winnipeg hydro-electric plant as it now stands can supply some 14,000 customers more than the 36,000 at present taking energy from its lines. For this reason the City Light and Power Department are justified in inaugurating a vigorous campaign for the greater use of the smaller electrical appliances and also of the electric range, which is already used in the city of Winnipeg probably to a greater extent than in any other city in Canada.

The sales manager of the Winnipeg City Light and Power Department, Mr. R. A. Sara, recently outlined a campaign beginning in February and which will continue through the summer season. In February they pubilshed a booklet entitled "Brighter and Happier Hours in Your Kitchen." This was an attractive booklet, explaining the advantages of using electricity for cooking and for the operation of all appliances

The department published an attractive booklet.

in the home, giving figures on cost, a number of useful recipes, the written opinions of a number of Winnipeg householders who had used electricity for cooking purposes, and finally a list of Winnipeg users of electric ranges, running into six pages of the booklet.

An advance copy of this booklet was sent to the Winnipeg Free Press, which published a good leader, entitled, "An Enterprising Civic Department," pointing out, among other things, that, while the cost of practically everything which enters into our daily life has increased, electricity alone is lower. The article also pointed out the universal use now being made of electricity in the homes, hospitals, cafeterias, lunch rooms, hotels, offices, and so on, and finally pointed out that the use of electricity developed from water-power conserves our fuel supply.

The following day the department mailed a copy of the booklet, accompanied by letter No. 1 to every individual whose name appeared in the booklet. A little later, March 22, they posted 10,000 of letter No. 2, with return postcard enclosed. This letter was addressed to the lady of the house. A copy of the booklet mentioned above, accompanied by an invitation to visit the showrooms of the department was sent to every person replying to letter No. 2.

For those failing to reply to letter No. 2, letter No. 3 was prepared and addressed to the man of the house, also with a return postcard.

On March 26 an advertisement appeared in the three city dailies offering prizes to school children for the best essay on "Electric Cooking." This advertisement is shown herewith. In May it is planned to issue a letter pointing out the advantages of electric cooking in hot weather. Each month further advertising matter in the form of 36,000 carefully-worded leaflets (different each month) are being enclosed with the

Contest for School Boys and Girls

$100 IN PRIZES $100

Any Winnipeg School Pupil Eligible

The government and the press are urging the public to conserve fuel and food, and in order to familiarize the citizens of Winnipeg with the savings that can be effected in both fuel and food, by the use of ELECTRIC fuel for cooking, we offer the following prizes to local boys and girls for the best essay on "The Advantages of Cooking with an Electric Range"

First Grand Prize $25.00 Second Grand Prize $15.00

Four Classes—Three Prizes in Each—To give the younger children the same opportunity as those in the advanced grades the following prizes will be awarded, according to age, class one, ages 10 to 12; class two, ages 12 to 14, class three, ages 14 to 16, class four, ages 16 to 18. First, second and third prize in each class will be awarded after the Grand Prizes

First Prize, $8.00 Second Prize, $5.00 Third Prize, $2.00

All essays must be in City Power Office by 12 noon, April 4th Winners will be announced Monday, April 10th

Offered prizes for best essay.

monthly lighting accounts. All envelopes have an advertisement printed on them, matter being changed each month (this also applies to the envelopes used by the municipal water department for sending out water bills).

For several weeks this department have also been holding business talks from 8.30 a.m. to 9.15 a.m., when a number of subjects have been discussed, as shown by the accompany-

ing program. These have proved most beneficial, as not only have they been instructive, but they have created a more general interest among the staff. The department at the present time is inaugurating "team work" among the employees. All willing to canvass and sell ranges in their spare time are requested to enter their names; teams comprising equal numbers have been selected by a committee and a captain chosen by each team. Prizes are offered for the best results of teams each month; also for best individual work. This scheme

started on April 1, and results are not yet available, but at last reports meetings were being held by the different teams for the organization of this campaign. Both men and women solicitors are out on a commission basis, and a system of follow-up has been inaugurated, which is kept track of by a card-filing system.

The department report that they have already sold more than five times the number of ranges during the first three months of this year as were sold in the same period last year.

PROGRAM OF CONFERENCES
CITY LIGHT AND POWER DEPARTMENT
DAILY, from 8.30 to 9.15 a.m. SHARP
Commencing Tuesday, Feb. 19th, 1918.

1st Day—R. A. Sara, sales manager City Light and Power Department: "Object of Conferences—Program—Suggestions on What Is Required."

2nd Day—J. G. Glassco, general manager City Light and Power Department. "City Light and Power Department, Historical and Financial Review."

3rd Day—H. W. Billing, manager Northern Electric Company: "Salesmanship."

4th Day—(Friday, 22nd) G. W. Markle, managing director Henry Birks & Sons: "Efficiency in Selling."

5th Day—A. J. Crosbie, meter superintendent, City Light and Power Department: "Electric Meters."

6th Day—W. P. Tice, Northern Electric Company: "Hughes Electric Ranges."

7th Day—W. E. Wright, manager National Cash Register Company: "How to Close a Sale."

8th Day—F. J. Malby, assistant accountant, City Light and Power Department: "Analysis of Sales of Current as Shown by Hollerith Statistical Department."

9th Day—Demonstration of sale of electric range.

10th Day—S. Thorn, Great West Electric Company: "Moffat Electric Ranges."

11th Day—R. V. Slavin, power engineer, City Light and Power Department: "City Light, Power and Heating Rates."

12th Day—E. V. Caton, chief engineer, City Light and Power Department: "Electric Heating of Water."

13th Day—J. Swan, appliance salesman, City Light and Power Department: "Gas Stoves—Why NOT to Use Them."

14th Day—A. J. Appleton, operating superintendent, City Light and Power Department: "Characteristics of Different Loads."

15th Day—Theo. A. Hunt, K.C., City Solicitor: "Service to the Public."

16th Day—Advertising: "Discussion as to Form and Mediums."

Further subjects will be added from time to time as occasion arises. Conferences will be continued two mornings a week, after the course is completed, to discuss points which arise and to supply information to salesmen and formulate policies.

Program subject to change as occasion may arise.

Letter No. 1

Dear Sir:

"BRIGHTER AND HAPPIER HOURS IN YOUR KITCHEN" is the title of a booklet just published which will be of particular interest to you. A copy is enclosed. In connection therewith we have taken the liberty of referring, on Page ..., to the installation of an Electric Range in your residence.

We have endeavored to embody in this publication the most up-to-date and complete information obtainable on Electric Cooking, Electric Washing, and other applications of Electricity in the home, with particular regard to their use IN WINNIPEG. You will observe that, with the exception of one or two letters from world-famous cooking experts on page 10, all of the references, recommendations, and other data refer to our own city, WINNIPEG. The lists of users contained on pages 23 to 28, inclusive, will give an idea of the large number of our citizens who are already cooking exclusively with electricity.

We trust that the recipes on pages 12 and 16 will be of service to you.

Are there any points about Electric Cooking or the application of electricity to any problem in your home on which you would like further information? Is your Electric Range satisfactory? Is it economical, and can you suggest any improvement? This subject is vital, particularly in these days of the high price of fuel and coal shortage.

Yours truly,
CITY LIGHT AND POWER DEPARTMENT.
R. A. Sara,
Sales Manager.

an **ELECTRIC RANGE**
Will Cut Your Fuel Bill, for Cooking, in HALF—

"COOK BY WIRE"

"ELECTRICITY"—*The Cheapest Fuel for Cooking*

All envelopes have advts. printed on them.

Letter No. 2

Dear Madam:

Last year 647 homes in Winnipeg, which formerly used high-priced gas, wood or coal, found it profitable to cook with low-priced electricity. The average saving effected by each in 1917 was $43.00. Not only did they save money, but they found it more convenient, cleaner, safer and that their cooking required less attention. These electric range users enjoy the lowest rate on this continent for fuel. They have proved

that the electric range saves food, that they have more time for pleasure, or other work; and the time they spend in the kitchen is enjoyable because it is a pleasure to cook with electricity. Probably one of your neighbors or friends is included in the above number and you would like to obtain direct information from them regarding their experience with electric cooking.

If you will sign and mail the enclosed Post Card we shall be pleased to send you a copy of our new booklet, "BRIGHTER AND HAPPIER HOURS IN YOUR KITCHEN."

It enumerates the advantages of electric cooking, its cleanliness, economy, safety and helpfulness. It contains photographs and descriptive matter of the newest and most up-to-date electric ranges, recipes, gives illustrations of a street in which EVERY HOME cooks exclusively with electricity, dozens of recommendations from people in Winnipeg cooking with electric ranges, and five pages of names and addresses of Winnipeg homes which "Cook by Wire." It shows how an average saving of $43.00 per year is made.

You will place yourself under no obligation whatever in asking for this booklet. The only criticism we have received to date is that it is rather expensive. We are at your service, and would like you to have a copy of "BRIGHTER AND HAPPIER HOURS IN YOUR KITCHEN."

Will you forward the enclosed card **now?**

Yours truly,

CITY LIGHT AND POWER DEPARTMENT,

R. A. Sara,

Sales Manager.

The City of Winnipeg Hydro Electric Plant, as it now stands, CAN supply 50,000 consumers, and practically the same overhead and financial charges will apply and the same staff will serve that number of consumers as now serve the 36,000 consumers already using City Light and Power.

IF 50,000 consumers are obtained, the COST of service per consumer will be greatly decreased, with a corresponding effect on rates charged.

ARE **YOU** USING CITY LIGHT and POWER?

These are attached to all letters.

Letter No. 3

Dear Sir:

In your office or factory you install new labor-saving machines to expedite your work and save time and money. If efficiency calls for these devices in the factory or office why not in the home? Help in the home is hard to get and more expensive than ever before.

Are you satisfied to let **your** wife worry along with an out-of-date cook stove when an electric range will save her hours of labor and transform the kitchen drudgery into "Brighter and Happier Hours"? Incidentally **you** will save half of the price you now pay for fuel for cooking, whether you use coal, wood, or gas.

You have probably entered your home many evenings and found the air heavy with the odor of half-burnt gas and your wife played out, after hours of work in the vitiated atmosphere. What a difference in the electric kitchen!—pure air, better cooked foods, your wife and children happier and healthier because electricity gives heat and nothing but pure heat.

Do you know there are streets in Winnipeg in which **every** home cooks exclusively with electricity? One of these streets is shown in our new booklet.

"BRIGHTER AND HAPPIER HOURS IN YOUR KITCHEN" not only states the advantages of electric cooking, its cleanliness, economy, safety and healthfulness, but also contains photographs and descriptive matter regarding the newest and most up-to-date ranges, recipes, dozens of recommendations from your friends and neighbors in Winnipeg who are cooking with electricity. Ask them how they like it. They will confirm our statements.

We would like to forward "BRIGHTER AND HAPPIER HOURS IN YOUR KITCHEN" if you will sign the enclosed Post Card and return it. This will place you under no obligation. Will you do it NOW?

At your service.

CITY LIGHT AND POWER DEPARTMENT,

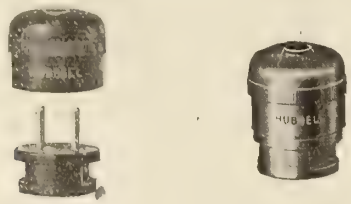
R. A. Sara,

Sales Manager.

Low Price Warming Pad

To fill the demand for an electric warming pad at a less price than its standard 12 x 15 in. pad the Westinghouse Electric and Manufacturing Company has placed upon the market one of these pads, with dimensions 9 x 12 in. This pad is equipped with 15 feet of cord, with attachment plug. No switch is provided, the current being turned on and off at the lamp socket or by separating the attachment plug. To prevent overheating, two thermostats are enclosed in the pad. These are connected in series, and should the temperature rise to a point near the maximum safe value, one or the other will open the circuit. Upon a fall in temperature, the thermostat will reclose the circuit, thus maintaining the heat at a uniform temperature. This pad, which is enclosed in a fawn-colored felt cover, is very soft and pliable, thus allowing it to conform easily to any part of the body. Its marked superiority to the old-fashioned hot water bottle is well known, some of the advantages being its instant availability, its continued heat at uniform temperature, the absence of any danger of overheating or scalding the patient, or of wetting its surroundings, and the low cost of operation.

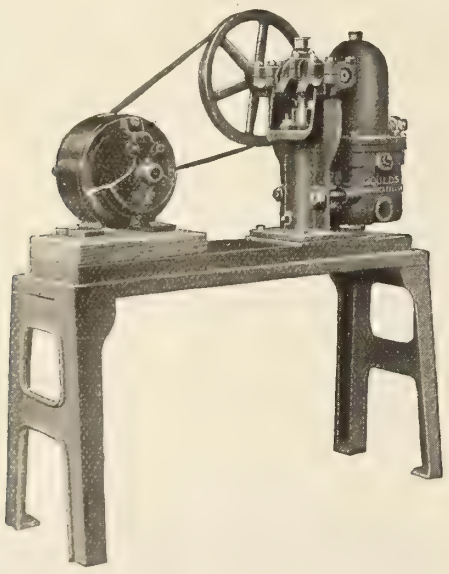
A Vest Pocket Power Plant



The Liberty Bell transformer is something new in the construction of bell transformers, in that it is of the socket type, and may be connected to the line by simply screwing it into any Edison base socket or receptacle. This permits even the inexperienced to connect it, and increases sales by cutting down the installation charges, which are generally so high as to impede competition of the bell transformer with batteries. Also the method of installation permits easy removal from one house to another, should the family move. All bothersome soldering is done away with in the installing

of this transformer. From the dealers' and jobbers' standpoint the extreme light weight and high capacity are important points. The complete weight is only ½ pound, and the 10-volt type will ring four 2½-inch bells, while the 16-volt type will ring seven 2½-inch bells. The transformer is enclosed in a neat black enameled case, with secondary terminals brought through a porcelain block, conveniently placed. The transformer is well made and impregnated, and does not depend upon any case-filling compound to exclude moisture. The device will not burn out on short circuit of the secondary terminals and claims an input of only 10 watts on short circuit. This transformer is also handy for the electrician in testing, being much lighter and less cumbersome than several dry cells to carry to the job.

Composition Motor Plug



Harvey Hubbell, Inc., have placed on the market a composition motor attachment plug, No. 6179. This plug is designed for use with devices employing small motors, such as vacuum cleaners, floor-scrubbers, and the like. It is constructed of a high-grade, heat-proof composition, measuring,

assembled, 1 5/8 in. in length and 1 1/32 in. diameter at bottom of base. The portion with contact blades is arranged with holding slots or grooves for fitting into the apparatus, and all current-carrying parts of the portable body are carefully concealed within patented arcing chambers to prevent accidental contact.

New Electric-Driven Pump for Small Capacity Services

The Goulds Manufacturing Company, Seneca Falls, N.Y., have recently developed a new pump for service in homes, summer cottages, camps, dairies, small hotels, etc. This pump is known as the "Hi-Speed," and its predominating feature is its high speed of 500 r.p.m., which allows the pump to be belt-connected to the motor with only a small reduction and consequently with a small pump pulley instead of the larger

diameter pulley commonly used. The pump is of the vertical reciprocating type, and is suitable for pressures up to 43 pounds or 100 feet elevation. It is made in two sizes—1 1/4 in. diameter with 1 1/8 in. stroke and 2 in. diameter with 1 1/8 in. stroke. The former has a capacity of three gallons and the latter a capacity of six gallons per minute. The outfits are furnished with 1/4 horse-power, 1,750 r.p.m. Robbins & Myers motors.

Favorable Annual Report

The annual report of the Canadian Westinghouse Company for the year ending December 31, 1917, shows gross earnings from manufacturing operations of $1,567,199; net earnings are $846,276, and, after dividends are paid, there is a net balance of $347,024, which amount, added to the balance from the previous year, leaves a balance as at January 1, 1918, $1,301,616. The total assets of the company are now placed $3,955,110

Quiet Berwick Goes "On the Map"

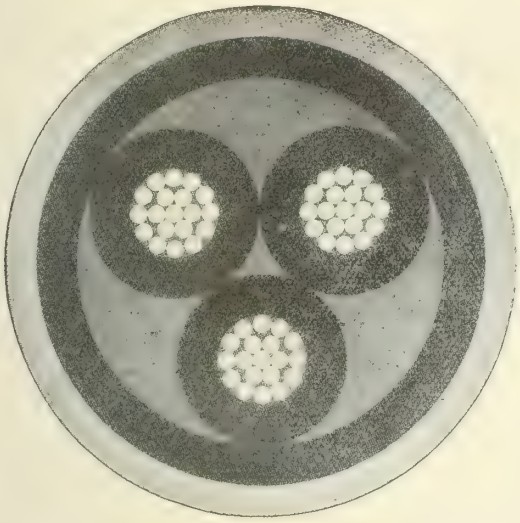
A Halifax reader sends us the following from the "Herald" of that city. The cost of current for water-heating, under the circumstances, would not be prohibitive:

Berwick, April 2.—This town from now on will be "on the map." The progressive element have won out, and by a three to one vote have decided to install an electric light and power plant. Water and sewerage are next in order. Confidence is shown in the commission which is to handle the new development. The commissioners are F. B. Chute, M. L. Nichols, and E. W. Margeson, and it is understood they are to make a mill site about five miles distant and put in a new dam to provide the necessary water-power. There has long been objection to modern innovations in Berwick, and at the meeting referred to above one of the "diehards" used the following argument: "Why, we don't want the new-fangled things—lights, water, and sewerage. Every spring I have the missus heat some water and I take the washtub out on the kitchen floor and after everybody has gone to bed I splash around and have a good wash, and there have been some springs when I didn't have to."

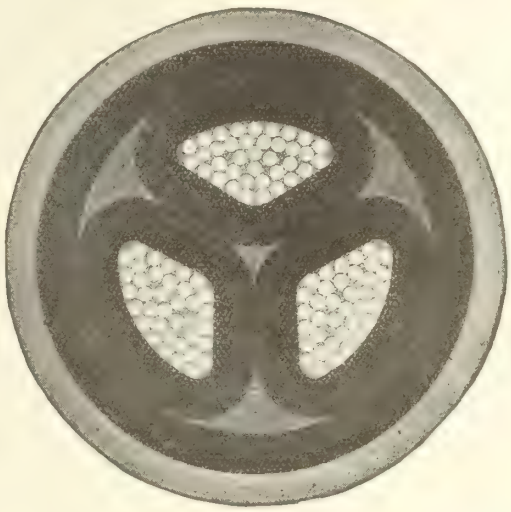
Personal

Mr. Frank T. Groome, sales manager Benjamin Electric Company of Canada, who recently underwent an operation for appendicitis at the Western Hospital, Toronto, is reported making satisfactory progress. Mr. Groome has been removed to his home, and expects to be back in his office in two or three weeks.

Trade Publications



Boiler Economy—Booklet entitled "A Guide to Boiler Economy," issued by the Canadian General Electric Company, containing useful information on the operation of steam power plants.



Condulets—Condulet Suggestion No. 16, by Crouse-Hinds Company of Canada, describing and illustrating battery charging condulets installed in a car on one of the largest continental railroads. The distinguishing features of these fittings are that the receptacle contacts are so supported as to prevent their being spread, that the contact area is unusually large, that firm contact is obtained on both inner and outer contact members at all times, and that the installation of the receptacle is greatly facilitated by a split form of bracket.

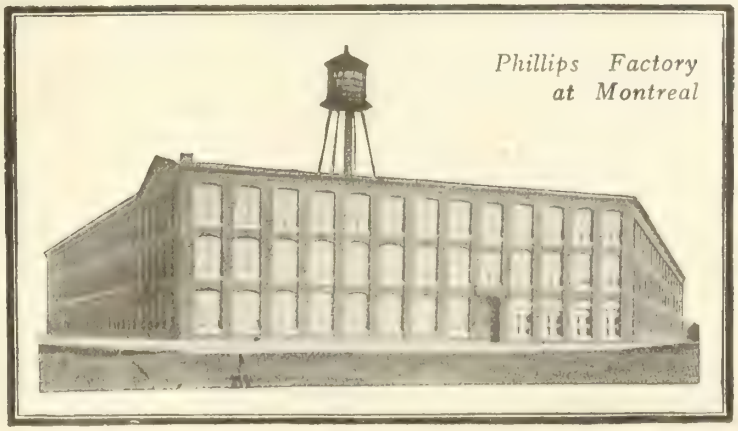
Lightning Arresters—A revision of Catalogue 1-A on lightning arresters has just been issued by the Westinghouse Electric and Manufacturing Company. After a brief treatment of lightning in general and ground connections, direct current lightning arresters are taken up. These are the familiar M.P. (multi-path) arresters, and the newer K-3 condenser type arrester. Both of these are designed especially for street railway use. The K-3 arrester contains a spark gap in series with a condenser, of the flat plate unit form having a capacity of one microfarad. To protect old equipment, in which the insulation has become weakened with age, the gap should be short circuited, as this prevents the voltage from rising to a point which might endanger the apparatus. With newer equipment, the spark gap should be left open, as this ensures that the condenser is always discharged, and therefore ready to take care of a larger static surge. The electrolytic lightning arrester for car service is also described. The line of type AK electrolytic arresters now includes a type provided with sphere gap having horn extensions on the higher voltages instead of horn gap only. There are a number of additions to the list of accessories and parts for these arresters. Outline drawings with approximate dimensions of type AK arresters in various settings complete the book, which is of much interest to electrical men having to do with transmission lines for power and railway purposes. Copies may be had on request at any Westinghouse branch office.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Phillips Factory at Montreal

Current News and Notes

Amherstburg, Ont.

The purchase of the Essex County Light and Power Company by the Hydro-Electric Power Commission has been completed. The properties were owned and controlled by the Detroit-Edison Electric Company. The price paid was $226,000, covered by bonds of the Ontario Commission. The plant comprises some 50 miles of 26,400 volt lines, distributing energy to Amherstburg, Kingsville, Essex, Leamington, Harrow, Canard River, and Cottam.

Hamilton, Ont.

The Minister of Labor has established a board of conciliation to deal with the dispute between the Hamilton Street Railway Company and its employees.

Kingston, Ont.

The city auditor's report shows that the past year's operation of the civic utilities commission were carried on at a loss, in the electric department, of $6,792.

London, Ont.

Negotiations have been re-opened, it is said, looking to the purchase of the London and Lake Erie Railway and Transportation Company by the city of London.

The plant of the London Electric Company was closed down on April 1, and some 15,000 customers were left without light and power. It is understood that a deputation is being arranged to go to Ottawa and urge upon the power controller the necessity of continuiing the operation of this plant.

The London and Port Stanley Railway Commission is authorized to increase the standard passenger tariff by 15 per cent. and the freight rate on coal by 15c a ton.

Following the collapse of the Springbank dam recently, it is announced that the work will be replaced on a larger scale, making possible the generation of a greater amount of electric power. As the result of the break, one section of London's streets is in darkness.

The employees of the London Street Railway Company have made a demand for an increase of 10c an hour in wages, bringing the maximum up to 38c. The company point out that their system showed a deficit of $24,000 last year.

Montreal, Que.

The Shawinigan Water and Power Company have under consideration the extension of their carbide and electrode plants. Operations have been commenced on the large acetic acid plant which the company are building at Shawinigan Falls for the United States Government, and part of the electrical equipment has been purchased.

Ottawa, Ont.

The fuel controller has issued an order which would seem to indicate that all small power plants operated by steam where hydro-electric power is available will be closed down to assist in relieving the fuel shortage. It would seem that the aims of the fuel controller and of the power controller will more or less interfere in this respect, as the power controller's orders are chiefly to the effect that hydro-electric power must be conserved wherever possible by the use of other sources of heat.

Regina, Sask.

The street railway union is asking the following schedule of wages: 32c for the first six months, 35c for the second six months, 38c for the second year, 42c for the third and following years; also a 10 per cent. increase for all other employees, aside from motormen and conductors, getting less than $1,500 a year. The city's offer of an increase ranging from 2 to 10 per cent. has been rejected.

Rosthern, Sask.

On Monday, March 25, the new electric lighting plant was started up here. This is a gas engine-driven generator system.

St. John, N.B.

The New Brunswick Power Company are making a request to the legislature for power to make an increase in their rates. The company ask that the fare in future be a 6-cent cash fare, with a 1-cent charge for transfers.

It is announced that the Commission of Conservation will make a survey of the water-powers of New Brunswick during the coming summer.

Temiskaming, P.Q.

The Kipawa Fibre Company, Ltd., propose to develop a water-power at Kipawa Lake, Temiskaming, P.Q. The energy will be utilized for the manufacture of bleached sulphite pulp. At present the water is sufficient to develop 20,000 h.p., which can be increased to 35,000 h.p. if conservation work at the head waters is undertaken. It is estimated that the proposed power development of 7,200 h.p. will involve an outlay of $650,000, with an addition of $350,000 for water-power rights.

Toronto, Ont.

The damage which occurred from fire in the factory of the Jefferson Glass Company, Carlaw Avenue, will be immediately repaired, and the plant will be running smoothly again within the month. The building was of fireproof construction, with a wooden roof, and it is principally this roof that was damaged. In the meantime the company have a heavy stock of staple glassware, from which immediate shipment will be made to fill orders. It is not anticipated that the fire will interfere in any way with the company's service to their customers.

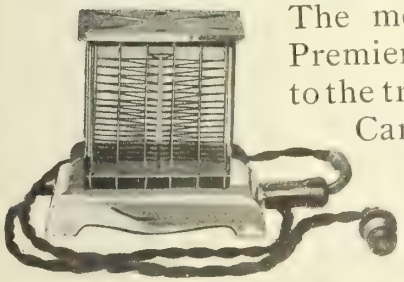
The Canadian General Electric Company, Ltd., have secured the agency for Canada of the Western Coil and Electrical Company, Racine, Wisconsin, manufacturers of high-grade violet-ray generators, high frequency outfits, etc.

Winnipeg, Man.

The City Council have instructed the city solicitor to prepare a by-law prohibiting the operation of jitneys in the city of Winnipeg.

Motor Operated Eraser

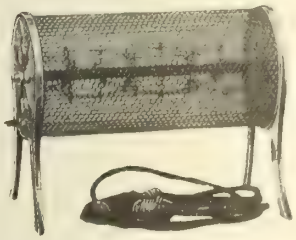
For use by draftsmen, the Coates Clipper Manufacturing Company is now making a motor operated eraser. The outfit consists of a 1/15 h.p. standard motor with a bail handle and 10 feet of cable for connecting to an electric light socket. It is fitted with 3 feet of ¼-in. cable shafting, with sliding sleeve connection, allowing for proper curvature of the shaft. This is covered with black braiding, and has nickel-plated sleeves throughout. At the end of the flexible shaft is a high-grade dental hand-piece and two mandrels, on which can be mounted discs of various kinds for erasing printing, waterproofing, pencil marks, and for cleaning purposes. Besides being used as an eraser, the maker points out that the rotating disc can be used by draftsmen and others for cleaning instruments, sharpening pencils, and the like.



Premier

"The Strong Line of Appliances"

Three things are winning electrical dealers to Premier appliances:



Quick Sales
Good Profits
High Quality

The men behind the Premier line are known to the trade throughout Canada. They have always stood back of quality products.

You can unhesitatingly guarantee any Premier—We do. Premier quality makes friends for your store. Premiers in your window advertise your store as a quality store.

PARLIAMENT BUILDINGS, OTTAWA

Tenders Wanted for Electric Conduit and Fittings

Sealed tenders will be received by the undersigned until noon, **April 23, 1918**, for Electric Conduit and Fittings required in the reconstruction of the above building.

All tenders to be based on the supplying and delivering on the site of the quantities of the schedule of material for electric conduit and fittings, in strict conformity with the specifications and the samples submitted, and to the satisfaction of the Architect.

Deliveries to commence so far as possible immediately after the signing of the contract and to continue as directed in such quantities as to ensure complete delivery by June 1, 1918.

The schedule of material, specification and any other information required can be obtained at the office of the P. Lyall & Sons Construction Company, Limited, Ottawa.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Minister of Public Works, for a sum not less than five per cent. (5 p.c.) of the amount of the tender, which will be forfeited if the parties tendering decline to enter into a contract when called upon to do so. If the tender is not accepted the cheque will be returned. If the tender is accepted an additional cheque for a sum equivalent to five per cent. (5 p.c.) of the amount of the tender must be deposited before the contract is signed. The total security will be forfeited if the contractor fails to complete the work contracted for.

Payments for material will be made monthly.

Samples must be submitted with tender.

The lowest or any tender not necessarily accepted.

Envelopes containing tenders to be marked, "Tenders for Electric Conduit and Fittings" and addressed to the undersigned.

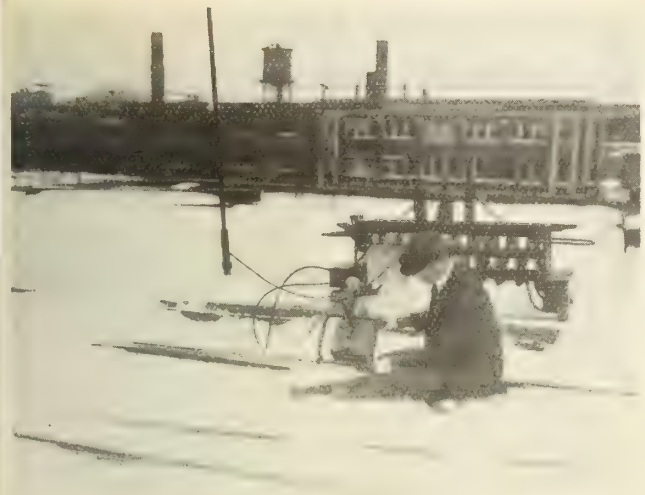
Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL
The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"
Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"
Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"
Fire-resisting paint, or colorless solution.



"ARMACELL"
Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"
Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"
for coloring electric lamps. Used in the Royal Navy. Weatherproof. Dries rapidly.

"ARMABRON"
Bitumen protective paint, elastic, acid-resisting, weatherproof.

Made in Canada

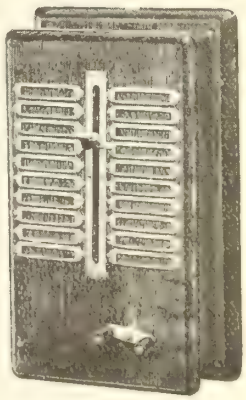
Water Turbines

Hydraulic Governors

High Efficiency Pumps

Vertical Turbines

shown in the accompanying illustration were designed and manufactured by us for the Hydro-Electric Power Commission of Ontario. They are among the largest water turbines installed in Canada and are characteristic of the high efficiency of our engineering department.



The services of these experts are at your disposal to consult on any of your engineering troubles.

BOVING HYDRAULIC & ENGINEERING CO., LIMITED

LINDSAY - ONTARIO

LOSING MEN

It is easy to lose track of a man in a plant of more than two departments. Just when you want him you cannot find him. Sometimes important matters are delayed while you are looking for the man that knows the details.

FINDING MEN

in a plant is also easy after you have installed a Presto-Call System. The Presto-Call is a Signal Service that we make in three sizes to call 5 men, 10 men or 20 men. It is easy to operate, and moderate in price; works with either vibrating or single stroke bells, or horns. The Presto-Call pays for itself in a few months.

Write for Booklet.

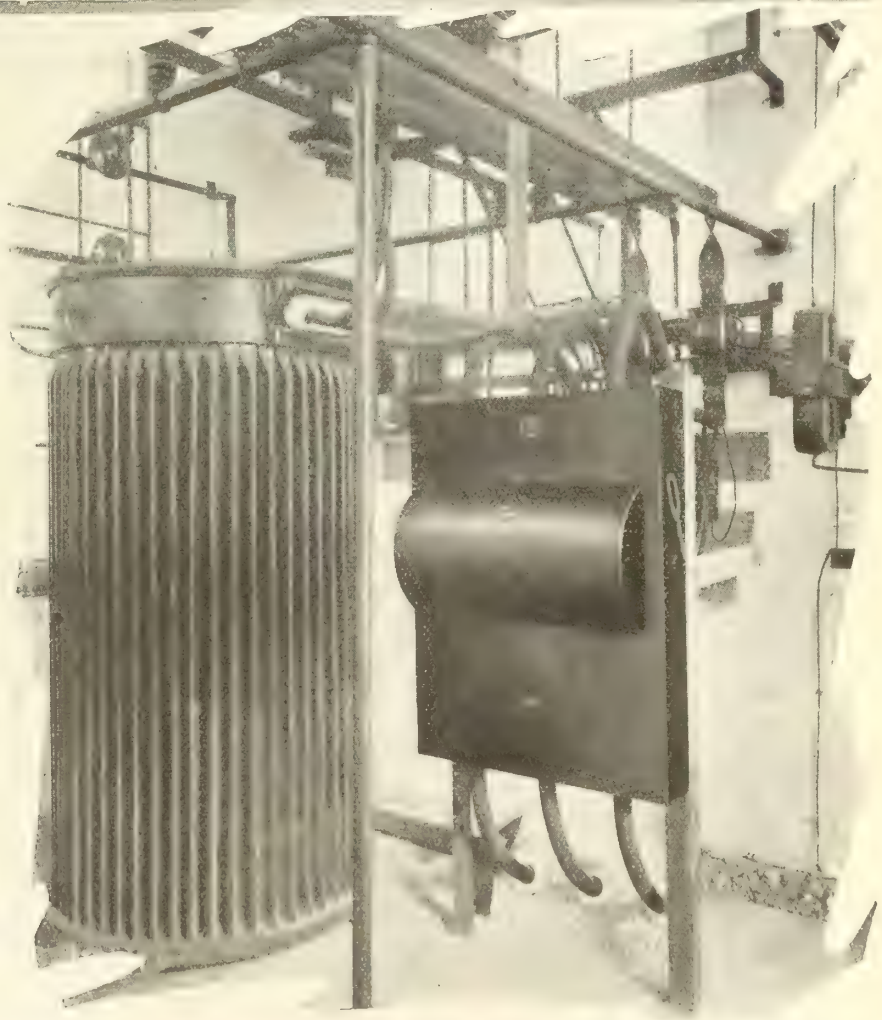
SQUARE D
STEEL ENCLOSED SWITCHES

An Ounce of Prevention—



Whenever an accident, that could have been prevented, occurs in your shop, the loss incurred by waste of time, expensive repairs and discounted good-will of your men far exceeds the cost of the measure that would have prevented it.

Square D Switches cost but little more than the old-fashioned open knife switch, and they afford triple protection:—complete enclosure of all live parts protects the men; the lock-off device protects both men and equipment; quick and positive action insures the service.

The Square D Steel Enclosed Switch is an investment that is paying a double return—saving and peace of mind in industrial plants ranging from the largest to the smallest shops. The saving effected is amazing. *Ask your electrician.*

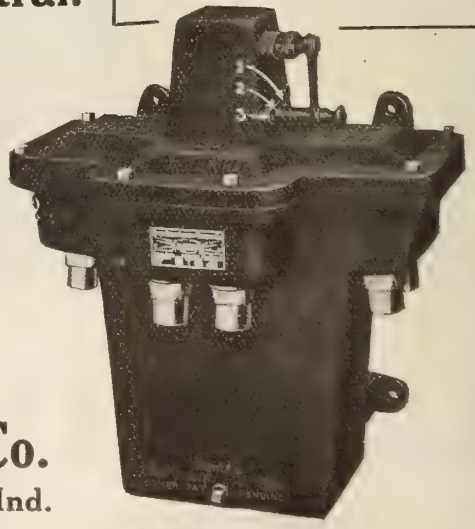
Couldn't make it more accurate—so we made it more flexible.

R. C. O. C. CONTROL



Is now local as well as central.

A new combination lever attachment enables watchmen to close the switch by hand in daylight or night hours to locate burnt-out lamps, or to avoid outages on load controlled by the switches while clearing series troubles. The switches may be cut out of service where White Way Systems are on only on Saturday nights, special occasions, etc. If put out of step by lighting, etc., they can be stepped ahead.

This refinement broadens the scope of usefulness of the R-C-O-C equipment.

At the Power House

At the power-house, using the regular series street circuit for the control wire, the operator controls series White Way systems having combinations of all-night and short-hour lamps on the same circuit, or multiple White Way systems, having all-night or combination all-night and short-hour lamps on the same circuit; or bridge, alley, sign, pump-motor circuits; or (a most important point) pole type or subway Constant Current Transformers, controlling loops of series-circuits. Watchmen, patrolmen, time switches, and irregular lamp hours are things of the past in R-C-O-C installations.

The New 2-in-1 Case

Subway or Pole Type R - C - O - C Switches may now be obtained in our new 2-in-1 case. This is a point to be remembered where manhole space space is limited, because two switches in the new case take up little more room than the single switch case, conserving space and weight on pole line installation.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations. Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que.; Ottawa, Ont.; Quebec, Que.; St. John, N.B.; Toronto, Ont.; Vancouver, B.C.; Victoria, B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.

THOS. C. IRVING,

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

Strength, Durability and Low Cost

Welding Shells for large water mains

are three essential features of all metal constructional work, and which invariably differentiate the article that is manufactured and produced by means of

Oxy-Acetylene Welding

During the comparatively short time since the inception of the Process, nearly all leading Canadian Manufacturers, and others employing running machinery, have taken advantage of the benefit it offers in their industry, for the reclamation of broken machinery, etc., and for any other purpose that involves the joining of metals.

Oxy-Acetylene Welding Gives a Better Product at a Lower Cost

Why not profit by its application to your industry? The initial cost of an Oxy-Acetylene Outfit is incomparably less than the money it saves and is an important factor in the conservation of material and speeding up production. Write to-day for further particulars—no obligation.

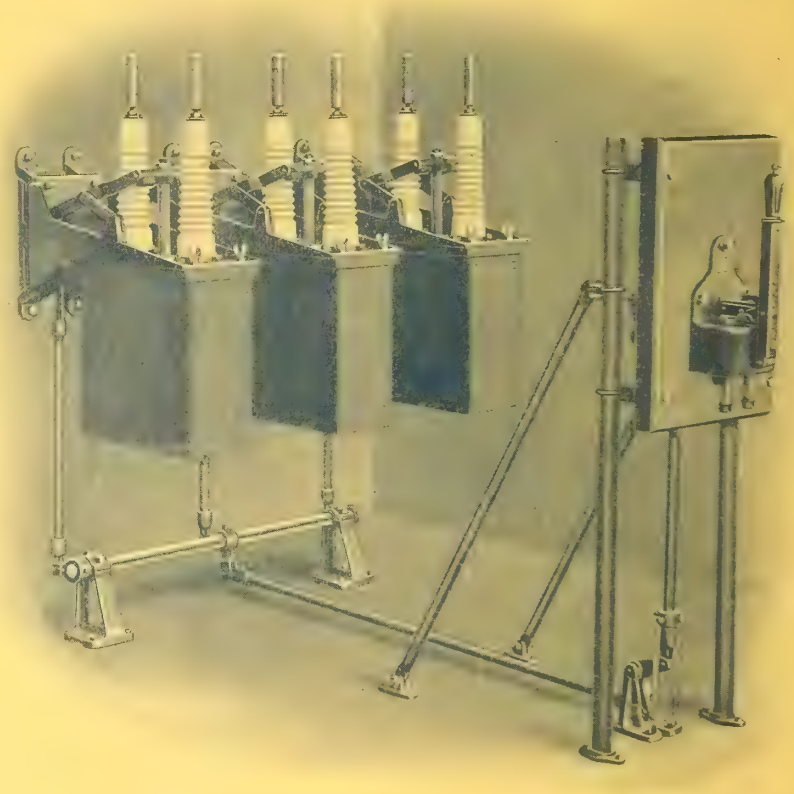
CONDIT

Oil Switches and Circuit Breakers

TYPE D-13

Maximum Amperes, 800 **Maximum Volts, 25,000**



APPLICATION

D-13 oil switches and circuit breakers are used for controlling and protecting generators, feeder circuits, transformer banks, etc. Their sturdy construction, high factor of insulation and ability to interrupt large amounts of energy, makes them highly desirable for controlling and protecting apparatus and circuits where uninterrupted service is of extreme importance.

CONDIT D-13 oil switches and circuit breakers are made in single, two, three and four poles, for manual remote control or electrical operation. They are furnished in 300, 500 and 800 ampere capacity for pressures of 15,000 volts or less, and for capacities of 300 and 500 amperes where the pressure does not exceed 25,000 volts.

CONSTRUCTION

All automatic forms of type D-3 oil switches and circuit breakers may be provided with undervoltage, shunt-trip and time-limit attachments in any combination. Overload types have their trip coils and calibration adjustments on the front of the switchboard, and the mechanism is arranged to prevent the operator from holding the switch closed during an overload or short circuit. The handles drop automatically to the open position when the circuit breaker opens, thus visually indicating the open position of the switch.

MANUALLY OPERATED—REMOTE CONTROL
25,000 Volts—300 Amperes

For the complete story of CONDIT Type D-13 Oil Switches and Circuit Breakers get Bulletin No. 419. Tells fully, yet concisely, everything you want to know about the application, construction and installation of this equipment together with valuable facts relative to attachments and accessories. Also includes important data on dimensions, cell construction, and standard arrangements for either manual or remote control. All CONDIT Bulletins should be in the files of every up-to-date engineer. Write our nearest house for copies.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

The "J C"
New Electric Soldering Iron

A new Era of Economy and Efficiency in rapid and thorough Soldering has been opened with the advent of J. C. Electric Soldering Irons.

The "J. C." Electric Soldering Tools give instant, continuous, conducted Heat and will give heat faster than it can be taken away by the metal on which it is used.

Note These Important Facts:

The New "J C" Iron

Gives Instantaneous Heat and will remain Hot.

Runs the Solder in 30 Seconds or less.

Saves Time—These Irons are saving from 40% to 70% time in plants where in use.

Saves Labor—Does not require skilled help.

Increases Production—Lessens the Cost.

Can't Burn Out, because there is nothing to burn out, and the only Maintenance Cost is for Carbons.

The Fastest, most Efficient, and most Economical Electric Soldering Iron on the market.

Light in weight—Rugged in construction.

Easy to Manipulate. Costs Little to Operate.

CONDUIT PIPE FITTINGS

Made in Canada

TYPE A

TYPE B

TYPE F

In introducing to the trade C.G.E. Conduit Pipe Fittings, we desire to call particular attention to the following points, in connection with their manufacture:

All C.G.E. Pipe Fittings are made of pure metal, carefully selected to ensure proper tapping and threading, well-japanned on the inside and electro-galvanized on the outside.

The cover openings are ground thoroughly flat and screw holes well centred.

All covers are fitted to castings before shipment, to avoid possible drilling error or extreme shrinkage of porcelain.

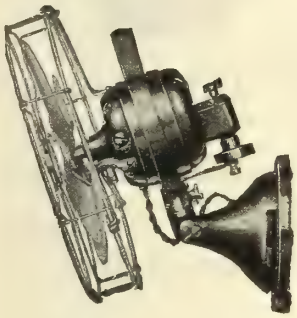
In general quality, high finish and uniformity of product, C.G.E. Fittings compare most favorably with any other make on the market.

Every shipment is warranted to maintain this high standard — samples will gladly be forwarded free of charge, on request.

C.G.E. Fittings comprise all standard types.

C.G.E. Fittings are approved by the National Board of Fire Underwriters, and by the Hydro-Electric Power Commission of Ontario.

AND THEY COST LESS MONEY



Bulletin No. 618, describing these Fittings, is now on the press, we will be glad to mail you copy on request.

ANNOUNCEMENT

New Management

"C.D.C" Service Boxes, Flush Type Boxes, Motor Starting Switches and Type E. Boxes are now being produced under new management. We wish to announce to all our customers and prospective customers that our unswerving rule will be a rigid inspection of each and every one of our products—a concentration on the Improved designs of our boxes and a service that will mean satisfaction to customers in everything that the word implies. "C.D.C." products are approved by the Hydro-Electric Power Commission of Ontario. Your enquiries will be appreciated.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price $3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price $2.00.

Alternating Currents—Examples for Students and Engineers, by Prof. F. E. Austin. Second edition, Vol. I. Published in 1916. 223 pages, illustrated. Price $2.40.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price $1.00.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price $3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price $2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price $1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price $2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price $2.00.

Electric Cooking, Heating and Cleaning, by Maud Lancaster. Published in 1914 by D. Van Nostrand Company. 330 pages, illustrated. Price $1.50.

Electrical Machinery—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price $2.00.

Electrical Meters, by Cyril M. Jansky, B.S., B.A. Second Edition, just published by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price $3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price $3.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price $1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price $1.50.

Engineers' Manual, by Ralph G. Hudson. Just published by John Wiley & Sons. 315 pages, illustrated. Price $2.00.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price $2.00.

Examples in "Battery Engineering," by Professor F. E. Austin, E.E. Just published. 90 pages, illustrated. Price $1.25.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price $1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price $3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price $2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price $2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price $3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price $4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price $3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price $2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price $1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price $2.50.

Standard Wiring, 1918 Edition, 24th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price $1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price $1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price $1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price $1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price $2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price $1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price $2.50.

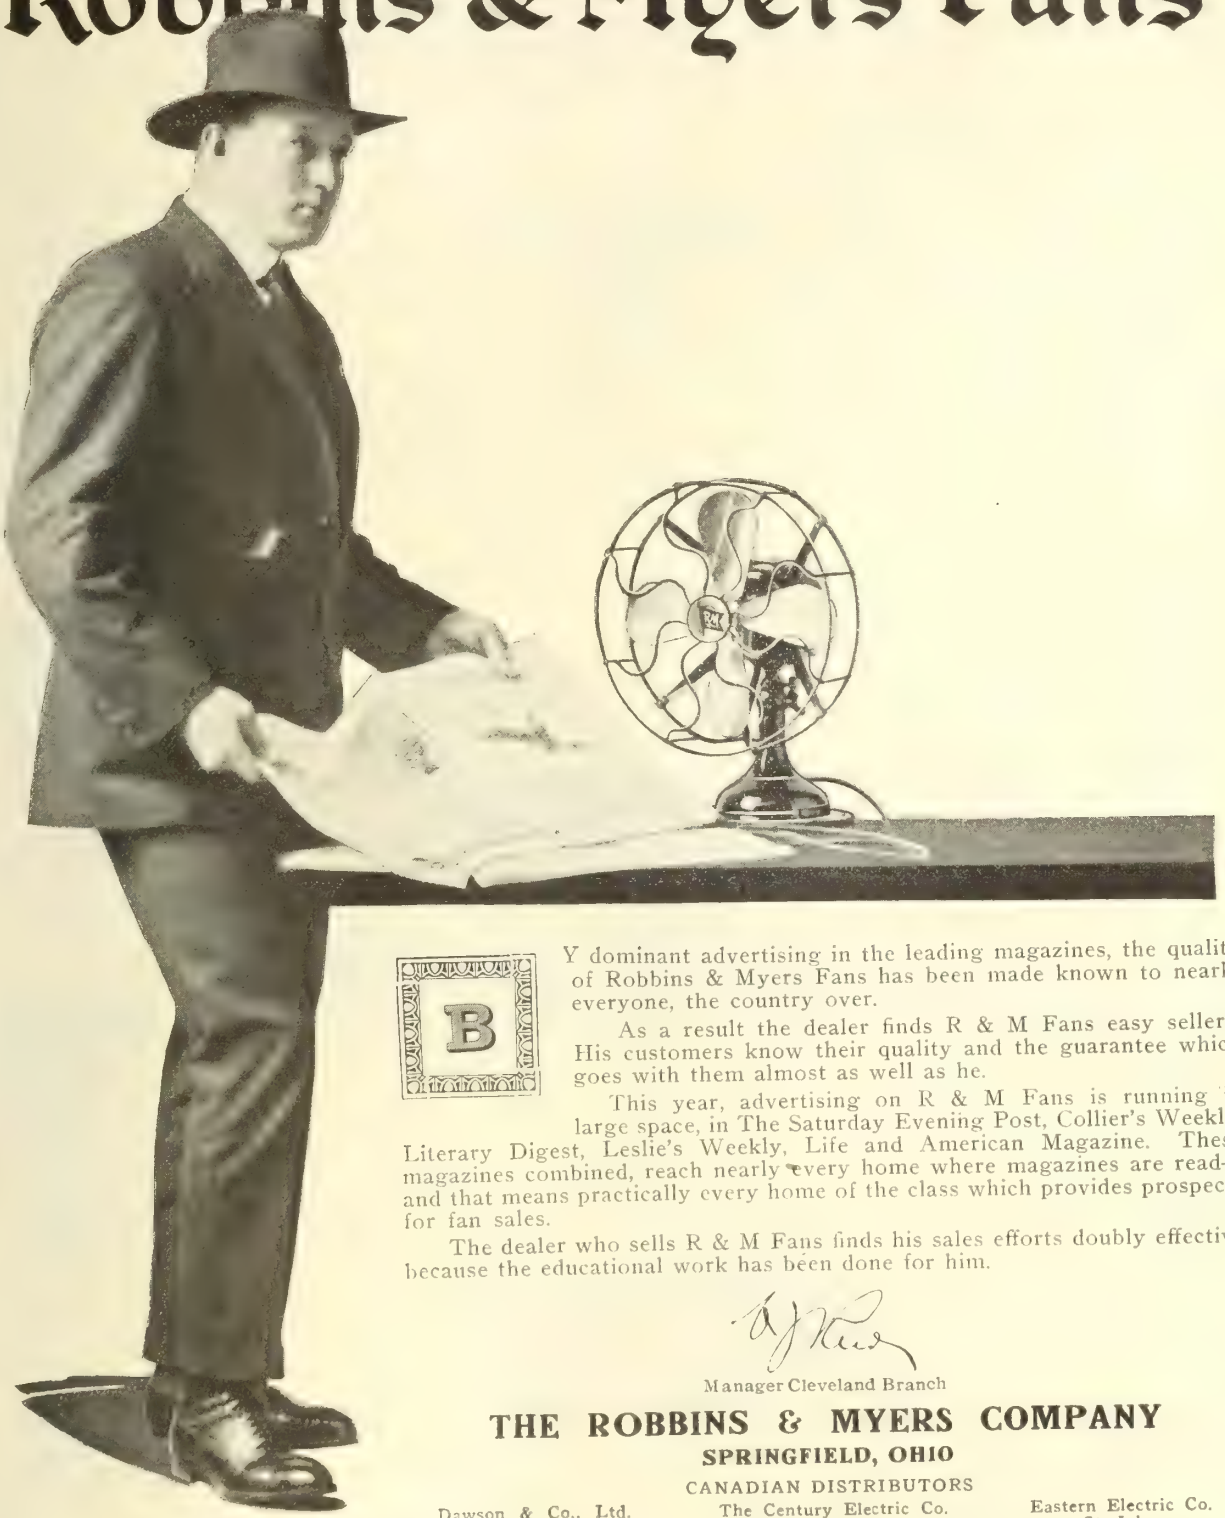
The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price $1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price $4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price $2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price $4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.



Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price $1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price $1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price $1.50.

ELECTRICAL NEWS, 347 Adelaide St. W., Toronto, Ontario

Robbins & Myers Fans

BY dominant advertising in the leading magazines, the quality of Robbins & Myers Fans has been made known to nearly everyone, the country over.

As a result the dealer finds R & M Fans easy sellers. His customers know their quality and the guarantee which goes with them almost as well as he.

This year, advertising on R & M Fans is running in large space, in The Saturday Evening Post, Collier's Weekly, Literary Digest, Leslie's Weekly, Life and American Magazine. These magazines combined, reach nearly every home where magazines are read—and that means practically every home of the class which provides prospects for fan sales.

The dealer who sells R & M Fans finds his sales efforts doubly effective because the educational work has been done for him.

Will the War be Followed by Concerted Effort for the Common Welfare?

The talk at the Montreal Electrical Luncheon on April 3 was of a different character to any other given this season. The speaker was Ex-Recorder Weir, and his address, with the somewhat ambiguous title of "Whither Are We Drifting," dealt with present-day social and economic questions, with particular reference to the manifesto of the British Labor party, a document which has been widely published in Great Britain and on the North American Continent.

There was, said the speaker, a growing feeling of what he termed social consciousness—a feeling that the present condition of society was not the best possible, and that our civilization was not the best possible. The minds of men were asking for something better. This craving for better conditions had characterized all history, and it would continue for all time. In England the policy of laissez-faire had been advocated by such eminent men as Bright and Cobden, who deprecated factory legislation on the ground that the government had no right to interfere between men and employers; but that idea had gone by the board and had been succeeded by a policy of socialism, which had been accentuated by the war. In England there had been a pastoral age, an agricultural age, a commercial age, and an industrial age, the latter accompanied by a number of social problems.

Instead of the laissez-faire policy there was a tendency for the government to control various matters, and he instanced old age pensions as one of the questions dealt with as the outcome of the socialist policy. In our day there was a feeling that men who labored with their hands or brains, or with both, should be animated with the idea of working for the common good, and the British Labor party in their manifesto distinctly included men who worked with their hands and those who worked with their brains. The old scramble by individuals was becoming obsolete. Just as in the war the people had been animated by a common spirit for patriotic purposes, so in the economic field there should not be a scramble for individual prosperity, but a concerted effort for the common welfare.

The speaker concluded by enumerating the main points of the British Labor manifesto, incidentally mentioning that the Canadian Government ought to materially extend their efforts to find employment for the returned soldiers.

Public Interest Best Served by Delaying Underground Work

The city of Montreal has failed in its application to the Quebec Public Utilities Commission to compel the Montreal Light, Heat, and Power Consolidated, Montreal Public Service Corporation, and Montreal Tramways Company to place their wires, cables, etc., in certain underground conduits in the down-town district built by the city, and to remove the wires and poles from the streets. The city issued instructions for the companies to use the conduits, but as these were not complied with, an application was made to the Utilities Commission. The companies replied that it was unreasonable to ask for this work to be done, having regard to the difficulty and cost of obtaining supplies.

The judgment of the commission is that the service to the public will not suffer by allowing present conditions to remain, and that there was evidence of the severe restrictions upon the supply of the necessary material, due to war conditions. "It is beyond all question," continues the finding, "that the expense involved in doing the work required would be greatly in excess, apparently 100 per cent., of that occurring in normal times."

In the opinion of the commission, the compelling of the work would not be commensurate with the sacrifice entailed by its immediate achievement, even if that were possible. "The public interest would be best served by deferring the work to be done until such time as present conditions shall have altered. The application is not allowed for the present. It is, however, to be distinctly understood that the finding goes no further than merely suspending the work to be done for the time being." The rights of the city are still maintained, including that of a renewal of the application at any time it may deem proper.

Conserving Fuel in Montreal

With a view to conserve fuel, the Montreal Light, Heat, and Power Consolidated and the Montreal Tramways Company have made an agreement under which the former will supply the Tramways Company with additional hydro-electric power, thus restricting the use of coal for the Tramway Company's steam plants. The agreement was due to the efforts of the fuel controller, who brought the companies together. The arrangement will continue for 18 months, and is estimated to save about 37,000 tons of coal. The Tramways Company is supplied with a certain amount of power, under agreement with the Montreal Light, Heat, and Power Consolidated, but the peak load, at the busy hours, is taken care of by the Tramways Company's steam plants, a new plant having been recently installed.

The new agreement is on a meter basis, and is likely to call for about 10,000 h.p. per annum, and may possibly be larger than these figures. The great object is to save as much coal as possible, involving a minimum operation of the Tramways Company's steam plants.

The contract, of course, means an additional call on the

resources of the Power Company. The two new units at Cedars will probably be ready in three months, so that the company will then be in a position to more than cover the larger requirements.

The demand for power in the province is increasing, largely for manufacturing purposes. Many new industries have been, and are being, located in the province, due to the facility with which cheap and abundant power can be secured. The power companies are making every effort to meet this demand and also to provide for future requirements. Besides the addition to the Cedars plant we have the important development of the Southern Canada Power Company at Drummondville and the contemplated addition of two units by the Laurentide Power Company.

The Power Controller's Latest Order Helps the Situation

Mr. Drayton has somewhat cleared the Ontario power horizon by his latest order, which virtually amounts to a pooling of all the power generated at Niagara for distribution throughout Ontario. In addition he has made arrangements with the private companies concerned for the operation of their steam plants at Toronto and London, guaranteeing certain protection to these companies against the abnormal cost of coal and the difficulty of obtaining it. Such action will appeal to the general public as in the best interests of those industries which are most necessary for the prosecution of the war.

It is not evident on the surface whether the Hydro or the private companies stand to gain (or lose) most by this pooling arrangement. Generally speaking, the greatest advantage would appear to accrue to the side on which the need for more power was the most urgent The main point at issue, however, is that all the power we can possibly render available is now to be applied at strategic points in the most effective manner.

High Tension Phenomena at the A.I.E.E.

One hundred and ten members of the Toronto section of the A.I.E.E. were privileged to see actual demonstrations of testing at 250,000 volts, the use of the sphere gap for measuring high voltages, and the formation of corona, at the Hydro Laboratories last Friday. The occasion was a paper by Mr. W. P. Dobson on "High Voltage Phenomena," and the experiments contributed to the attractiveness of the subject. In Mr. Dobson, it was clear, the section boasts a member who is a physicist of considerable attainments and a mathematician of a high order. The paper, which was devoted to high voltage measurements, the corona voltmeter corona losses, and the effects of switching on high tension lines, showed great thought in its preparation and a careful study of the work of recent investigators of the subject. An interesting test demonstrated the reliability of the sphere gap in comparison with the needle gap for measurement at different frequencies. This paper indicates that much good work is being accomplished in the commission laboratories in the direction of standardization and research at high voltages.

The Open Boat

"When this here War is done," says Dan, "and all the fightin's through,
There's some'll pal with Fritz again as they was used to do;
But ***not me,"*** *says Dan the sailor man,* ***"not me,"*** *says he*
"Lord knows its nippy in an open boat on winter nights at sea."

"When the last battle's lost an' won, an' won or lost the game,
There's some'll think no 'arm to drink with squareheads just the same;
But ***not me,"*** *says Dan the sailor-man, "an' if you ask me why—*
Lord knows its thirsty in an open boat when the water-breaker's dry."

"When all the bloomin' mines is swep' an' ships are sunk no more,
There's some'll set them down to eat with Germans as before;
But ***not me,"*** *says Dan the sailor-man,* ***"not me,*** *for one—*
Lord knows it's hungry in an open boat when the last biscuit's done."

"When peace is signed and treaties made an' trade begins again,
There's some'll shake a German's hand an' never see the stain;
But ***not me,"*** *says Dan the sailor-man,* ***"not me,*** *as God's on high—*
Lord knows it's bitter in an open boat to see your shipmates die."

—C. F. S. in "Punch"

The Application of Education to Industry

An Address Delivered before the Annual Meeting of the Joint Committee of Technical Organizations, Ontario Branch

By Col. David Carnegie*

Before referring particularly to the subject I have chosen for consideration this evening, I think you will be interested to know that since the formation of the Inventions Committee of the Imperial Munitions Board in February, 1917, we have examined approximately 500 proposals, sent from all parts of Canada and other countries. The following gives the number of proposals from each province in Canada and from other countries:

Inventions, March 19, 1918—Total Proposals Received to Date, 543

Ontario	223
Quebec	46
Manitoba	12
Saskatchewan	30
Alberta	27
British Columbia	28
New Brunswick	6
Nova Scotia	22
Prince Edward Island	2
Newfoundland	1
Yukon	1
United States	129
England	4
Australia	1
New Zealand	1
France	2

Out of these we have forwarded 32 proposals to the Inventions Board in London.

One inventor sent as many as eight different inventions. The proposals have related to aeroplanes, protection of ships from submarines, designs of guns, shells, bombs, aerial torpedoes, tanks, and many other minor warlike subjects. Prior to the formation of our committee inventors knew of no particular department of government where to send their proposals for consideration, and no particular department had any specific organization formed to examine carefully the proposals submitted. We have on our committee representative members of the military and naval services of the Government of Canada, the universities, and technical societies, all of whom are voluntary workers. We have also the assistance of the Patents Office staff and other departmental branches of the Dominion Government where the proposals submitted require the investigation of specialists in their departments.

We think that the work of the Inventions Committee, although it has taken very little time from the regular duties of the officers of the Imperial Munitions Board, has served a very important purpose, and has awakened and developed many latent faculties. Evidence of genius has been marked, but the need for its direction and instruction in the elementary principles of science have been revealed in many of the proposals. It is because I believe that your society, consisting of technically trained men coming from different industrial centres in Canada, can be of great service in educating and directing the untutored that I have ventured to offer to you this evening some suggestions regarding the education of the industrial worker, the skeleton of which I presented to the members of the Canadian Mining Institute recently when dealing with "Some Problems in the Readjustment of Industry." I wish, therefore, to confine my remarks this evening to the functions of the educational committees of production boards for each industry, or of any other body organized with the same object.

*Member and Ordnance Adviser, Imperial Munitions Board, Ottawa.

The Functions of Educational Committees of Production Boards

In the address to which I have referred I suggested the formation of production boards for each industry, consisting of equal numbers of the representatives of the employers and employees in the district. The functions of these boards included, among other important duties, the education of industrial workers, as follows:

1. The vocational training of the child in preparation for his entry into industry.
2. The education of the actual producer (principally manual).
3. The education of the directors of production (both manual and technical).
4. The education of the distributors of production (principally financial and commercial.)

It might be advisable to look at the fundamental principles underlying industrial education before considering what might be the best kind of education.

Fundamental Principles Underlying Industrial and Technical Education for Each of the Classes Enumerated

The question might be asked: What is the object of our pursuits? Are we simply setting out to train humanity from childhood to become efficient producers in the world of industry? This would, indeed, be a worthy aim. Organized education in industry is surely better than systemless education and chaos. But that is surely not the only, or principal, object. I believe with Ruskin that "The entire object of true education is to make people not merely do the right things, but enjoy the right things; not merely industrious, but to love industry; not merely to learn, but to love knowledge; not merely pure, but to love purity; not merely just, but to hunger and thirst after justice." I am sure you will agree with me that these objects should underlie industrial and technical education, as well as every phase of education. It is not merely sufficient to turn out well-equipped and efficient workers in every class of industry most fitted to their natural bents, but to seek to make each worker discover the wholesomeness and happiness in the performance of every task, interpreting his experience in terms of pleasurable duty, which will bring not only personal gain, but will add to the interests of the community and nation. "No pleasure," says Bacon, "is comparable to the standing upon the vantage ground of truth." The great fundamental principle, therefore, underlying all education is truth—"truth in the inward parts."

Classes to Be Educated in Industry

Considering, then, the education of the human forces in industry we have: (1) The juvenile at school and at work; (2) the adult worker; (3) the director of production; (4) the distributor of production.

I wonder if a fifth class should be included—a class to provide the program of education? It is conceivable that our teachers may have misinterpreted the true fundamental principles underlying industrial education. It may even be necessary to break the moulds in which our teachers have been cast. In the light of present knowledge, I do not agree with Emerson when he says in that beautiful essay on compensation: "There is a crack in everything God has made," but if the exhibition of savagery in Europe for the past three and a half years is the outcome of the highest culture in science and art, surely science and art have been prostituted to fiendish

uses, or we are misguided in our interpretation of experience and the lessons learned therefrom, and there must be more than a crack in our man-made culture.

Are Our Standards and Goals Right?

If the world's higher education in the intellectual and industrial pursuits has led the people into such inhuman strife, is it unreasonable to suggest that we pause and consider whether anything is wrong with our standards and measures, or is all this slaughter the outcome of their wrong uses? Have we been listening to false prophets about the glory of that land which will be plowed by the most efficient machinery; where the labor of sowing and reaping will be reduced to a minimum? Do we see before us a culture and genius which will transform with a minimum of effort the raw materials of the earth's surface, bringing with them a wealth and ease which our tired bodies and hungry souls long for? Have we yet discovered that "man shall not live by bread alone"? Are we lowering the standard of manhood by the kind of goals we have set ourselves? There are other goals beyond the gold fields; beyond the money values of industry. If "man's chief end is to glorify God and enjoy Him forever," then our standards of culture which lead us from that end are unholy. All the cruelty, intrigue, disloyalty, and avarice, so rampant in the world, and particularly in cultured Germany, indicate a self-inflicted deformity of God's image, which it was man's proud fortune to possess. If the horrors of war are arresting our thinkers and opening new vistas of unexplored mind where spirit values instead of material values count in the true adjustment of our industrial affairs, there shall evolve from the carnage and scientific barbarism a new era in which a true interpretation of the loathesome experiences through which we have passed will bring out the value of the fundamental principles upon which our industrial education must be built. We shall then discover the principle underlying education which will give the worker the opportunity of maintaining efficient service with a maximum of enjoyment.

Ability and Interest Essential to Efficiency

In the suggestions I am about to make I recognize the futility of obtaining sustained, efficient service from any class of worker, either by hand or brain, unless the worker has discovered a pleasure and interest in his employment. I believe that the co-operation of these two great human forces—ability and interest—are absolutely essential to effective service.

1. Vocational Training of Children for Industry

For the past four years there has lain upon the shelves of Canada's bookcases one of the most comprehensive reports ever made upon industrial training and technical education. I could not refer any educational committee of production boards or similar organizations to better plans for their consideration than those recorded therein. Dr. Robertson, who was the chairman of the commission appointed by the Dominion Government to investigate the scope and nature of industrial training and technical education in Europe and America did not only record the facts and make recommendations to the Dominion Government concerning their application to Canada, but has never lost an opportunity of emphasizing the need of puting the recommendations of the commission into practical operation.

The People of Canada Desire Industrial and Technical Education

Dr. Robertson's report says that Canada does not only require such education, but longs for it. One thousand, four hundred and seventy-one men and women in Canada, representing the industrial, business, agricultural, home-making, and technical work of the Dominion, witnessed to the commission their anxiety to have better industrial and technical education for Canada.

Benefit of Vocational Training in Other Countries

Dr. Robertson's report also shows that great advancement has been made in industry in England, Scotland, Ireland, Denmark, France, Germany, Switzerland, and the United States by the addition to elementary education of manual training, domestic science, nature study, and school gardens. Children leaving school at 3 or 14 years of age are transferred at the age of 11 or 12 years to classes having what is called an industrial bias, commercial bias, and housekeeping bias, where a definite time is set aside for such education. Trades are not taught at such schools, neither do these classes displace general education from books. They are known as "elementary courses,' 'and have developed at an extraordinary rate in England and Europe. In Scotland, for instance, ten years prior to the war there were 162 schools, with 3,281 pupils, and in 1913 there were 1,945 such schools, with an attendance of 43,281 pupils.

Dr. Robertson's Proposal Has Provided a Program

It is not my object now to propose any detailed program for the vocational training of the child. My object, rather, at present, is to point to the source of information where well-considered thought has been given already to the subject, and to seek to indicate how the application of such plans to each industry could be established by the aid and harmonious co-operation of the producers in each industry and the educational authorities.

Co-operation of Educational Committees and School Authorities

The Educational Committee of the Production Boards, for instance, could work in the closest association with the management committee of the school authorities of each district, with a view to the selection and preparatory training of the children required periodically for each industry. Such selection would be made having in mind always the aptitude and interest of the child in the class of work to be followed. I am informed that in connection with the examination of school children in Australia phrenologists are employed by the government to discover the direction of their bent for industry.

By the co-operation of educational committees of production boards with the school authorities they could determine:

1. The nature and duration of training most suitable for boys and girls in the schools.
2. What partial attendance at schools and works was necessary during the earlier stages of industrial training.
3. The number of hours for study, manual labor, and recreation.

Duties of Educational Committees

The duties of the educational committees of production boards would also include the preparation of the courses of training in the works for juveniles; the number of hours for such training; periodic examinations, with a view to discovering progress in interest and enjoyment in the work as well as ability; the issue of certificates showing the standard attained in the particular branch of the industry; the consideration of rates of remuneration for each child during the period of training, and also the provision of suitable conditions for the welfare of the children.

2. The Education of the Actual Producers

Although it has been said frequently that there is little hope of educating more than an insignificant percentage of the large number of men and women once they have drifted out of boyhood and girlhood, there are many signs which encourage the hope that not an insignificant percentage of the workers are craving for knowledge and right leadership. Educational authorities have done a great work in providing continuation classes for general training in industry and in

arranging classes for special study relating to classified industries.

Technical Instruction in Works

These advantages are emphasized in the report of Dr. Robertson, to which I have already referred. They could be supplemented by making provision for the instruction of adults in districts where no schools exist, by the formation of classes for instruction by qualified teachers, many of whom could be found in the ranks of the industries over which production boards preside. Many of the foremen, superintendents, draftsmen and chemists could give manual and technical education in the tending of machines, the use of gauges, moulding, plumbing, blacksmithing, drawing, chemistry, etc. Certificates of qualification could be issued after a definite period of instruction and proved ability and interest. Such classes could be made so attractive that all branches of labor would be encouraged to qualify for a higher grade. The shop or yard sweeper, for instance, would have the chance of qualifying for any position requiring the highest skill in operating.

Workers' Educational Association

Perhaps the most encouraging sign of educational progress of recent years is the great movement begun by the workers themselves for the education of the adult worker, and known as the "Workers' Educational Association." It was founded in 1903 in England by a group of trade unionists, co-operative, friendly, and educational societies, and aimed "at nothing less than the restoration of education to its rightful place among the great spiritual forces of the community."

This association, pioneered by the industrial workers, joined hands in 1907 with the universities at a national conference which was held at Oxford, where seven representatives from the universities and seven from the representatives of labor formed themselves into a joint committee for the establishment of what is known as the "University Tutorial Class System." Every university in England to-day has its joint committee for tutorial class work, consisting of an equal number of university and working class representatives. A great alliance, therefore, has been formed between the sources of education and the organized working classes.

The story of the development of this work is most entrancing. In 1914 there were 2,555 affiliated societies, scattered over England and Wales. I believe that the educational committees of production boards would be able to obtain considerable help from the study of operations of the W. E. A. to enable them to formulate plans for classified education, particularly in districts where technical schools were not available.

2. Practical Training of Adult Labor

Many facilities during recent years have been offered to the adult worker in industry to improve his practical knowledge of his craft. Quite recently I received a description of a training school for employees, organized by the Recording and Computing Machine Company, of Dayton, Ohio. It had for its object the training of raw labor, men and women, to work to the closest requirements in precision work, the limits running as low as five ten-thousands of an inch. The works manager, Mr. U. Carpenter, had found that the method of introducing workers into factories and placing them on machines to learn their operation by the assistance of shop foremen and fellow-workers was not only costly but imperfect. The method adopted to overcome this common form of training was by having all the workers trained in a well-lighted room away from the factory, upon the kind of machines they were afterwards to operate in the large works. A few days', or sometimes weeks', training, by special teachers, qualified them to go into the works and operate machines without having any assistance from their fellow-operators, the foreman or leading hands in the factory.

Remarkable Advantages from Practical Training

Mr. Carpenter states that "in January, 1916, the average production of 31 women employees was eight pieces per hour." While operatives were apparently busy with this rate of production, my experiments showed that there should be produced from these machines, as a fair production, an average of 35 pieces per hour. We put our old operatives into the training department and within four weeks after the new and old operatives had been through this training department the average production was raised to over 35 pieces per hour, and to-day (January, 1918) the average is over 55 pieces per hour. The same results were obtained on all our work, such as machining, inspection, and assembling." These facts from actual experience confirm the opinions and recommendations of advocates of industrial training, and are sufficient to demonstrate the value of specific practical training. They also confirm the great possibilities of organized methods of labor, and show where work can be enjoyed while skill and output are increased.

Training and Examination of Adult Labor

The functions of the educational committee of production boards would include the classification of labor for such practical training and the direction of both men and women to the pursuit of higher grades of practical knowledge in the industry. Training courses, examinations, and certificates would be given, as in the case of juvenile workers.

3. Technical Training for Directors of Production

On first thought, the technical training for directors of production might appear unnecessary. Why should the director of production hold such a position in industry if not fully qualified, and, if fully qualified, why should educational training be necessary?

On reflection we are reminded of the technical facilities which are within the reach of directors of production who are helped by the technical press—patent office literature, proceedings from various institutions, reports of commissions and other organizations engaged in research and investigation for the solution of problems in industry.

Directors of production recognize that their education does not cease with their promotion to such positions, but rather the necessity of education increases. Much of that education which has to be secured outside the ordinary factory hours must be in tabloid or concentrated form. The real problem is to know how to place facilities for such education within their reach without overloading them with unnecessary information pertaining to other industries than their own.

Valuable Sources of Education Locked Up

In addition to the foregoing sources of information facilities are always available at the various universities and technical schools for evening study during the winter months. Lectures also are given at different institutions through which knowledge is imparted to directors of production, but it seems to me that the sources of concentrated technical education which ought to be of the greatest service to industry are locked up in volumes in different departments of the government—volumes the existence of which is not even known to the directors of production in industry.

There are, for instance, numerous volumes already issued by the Mines Branch, giving account of minerals, metals, fuels, and refractories, all of which are of vital importance to industry. In addition to these there are valuable reports issued by the Commission of Conservation, on questions of the utilization of Canada's resources, reports dealing with minerals, fuels, fisheries, game, animals, forests, lands, public health, waters, and water-powers, town planning, etc., information gathered by eminent men qualified to deal with the subject. There are also most valuable reports made by the

Department of Agriculture, the Department of Trade and Commerce, the Department of Labor, and other departments of government which would put industry under a deep obligation to the Dominion Government if they had the opportunity of utilizing the information contained in them. But, I ask, what is the value of all these records of industry? What percentage of men directing industry, such as manager, superintendents, chemists, and foremen, have ever heard of these valuable reports which minute investigation and much toil have made possible.

It has been my good fortune to have the opportunity of referring to many of these reports, and my regret has been that time would not allow of greater reference to them than was actually necessary in the prosecution of war work.

Central Authority for Classifying and Distributing Information

I cannot, however, believe that the task of wisely classifying for and distributing the results of those investigations to industry, through production boards or any other medium organized for this purpose, would be insuperable. I believe that special classification of information relating to problems and processes for each industry, together with the distribution of such information, could be undertaken by a central authority capable of dealing with the technical problems of industry as a whole. Such a central authority would not only become the principal body through which such knowledge would be imparted, but directors of industry would involuntarily turn to such an agency for assistance when in trouble.

Co-operation and Co-ordination of Sources of Information

If I were to venture to suggest for consideration a plan whereby the most efficient service could be rendered to industry through its directors of industry I would propose a union of the educational committees of production boards of each industry with the Industrial Research Advisory Council of the Government, or some similar institution which would have the authority to advise as to the use of all the technical educational sources of the country for the development of industrial research.

The value of such a union would be in the assurance of industry, through its production boards, receiving technical help and advice from the Industrial Research Advisory Council. With such co-operation and the co-ordination of the valuable technical departments of the government, universities, technical schools, and other institutions for industrial research, one can hardly estimate the value of such help to industry. Such co-ordination, in my opinion, is possible without any one of the institutions losing its identity or control. It might be necessary to re-arrange and classify the work of some of the institutions in certain respects, but such re-arrangement could be made after mature consideration.

Advantages Arising from Co-operation

Some of the advantages resulting from such a central authority as the Advisory Research Council would be as follows:

1. The classification of all information coming from the technical press, proceedings of institutions, reports of commissions, etc., suitable for the use of each industry, and distributing such information to the production boards concerned in each district. Such information could be supplemented with any observations and advice which in the opinion of the committees appointed by the Research Council would be of technical value to the industry concerned.

2. In addition to this source of information periodic conferences with directors of production in each industry could be arranged whereby discussions upon special processes or inventions could be held, with a view to the improvement of methods which would accelerate production.

3. Further, all information relating to standards of measurement, specifications for material, and standardization of processes would be supplied through the Industrial Research Council—in fact, the co-relation of the various departments with the valuable facilities for research in them could form the basis of an institution such as the Bureau of Standards at Washington and the National Research Laboratory, London, England, having committees for investigation and research in all technical matters relating to each industry.

In addition to this affiliation the production boards of each industry might be linked with the universities or technical schools of the district, so that in co-operation with the educational authorities facilities could be provided for the training of directors of production. To be afforded the privilege of using the various laboratories of the universities, colleges, and technical schools for experimental work which could not be carried out in the works of the individual manufacturer would be of great service to industry.

While I have referred particularly to Canada and her educational institutions which could be linked with organized industry, the same suggestions apply to the institutions and industries of Britain and other foreign countries.

Constitution of Central Authority

With regard to the constitution of such a central council for research the present body might wisely be enlarged to include the heads of such departments of the government now conducting research in different lines of industry. It might also be advisable to make the head of each technical department chairman of the section of the council's work relating to the operation of the government department over which he presides.

I believe the constituted machinery of the government, which has done admirable service in the past, with an efficiency which has been seldom recognized or fully appreciated, only remains to be geared up to some such central authority to make each department of the fullest value to the nation through the nation's industry.

4. The Education of Distributors of Production

We have, in conclusion, to consider the education of a class of workers who cover perhaps a wider field of operations as distributors of production than even the directors of production. They are not only concerned in recording statistics, accounting, and costing in relation to production, but in the distribution of products, involving shipping, railroading, and other means of distributing products—subjects in themselves which form a most important part of the problems of factory administration.

The work of the educational committee of a production board would include in a general way the consideration of the best systems of commercial training suitable for all branches of a factory's office staff, but there are, in addition, larger questions, which involve finance, accounts, costs, commercial law, the systematic study and familiar knowledge of which are essential if industry is to be established on an enduring foundation.

By linking the educational committees with the educational authorities whose institutions make a special study of this phase of educational work, plans could be more readily formulated for the education of distributors of production in every kind of development in commercial industry.

The Appointment of Advisory Council on Finance and Commerce

It might be found advisable to appoint a government industrial central financial and commercial advisory body of a nature and standing similar to that of the Industrial Research Council, but having for its object the classification of all matters of finance and commerce common or particular to each industry, and the distribution of such information as would

admit of the standardization of methods for educational development in factory administration, accounting, costing, commercial law, transportation, and all other matters relating to the interchange of production between buyers and sellers.

Such a council might consist of representatives of the leading financial institutions in the country, representatives of universities dealing with political economy and commercial training, representatives selected from the administrative side of large business houses, representatives from the institutions of accounting, representatives from the shipping and railroading companies, and representatives of the various government departments, such as customs, trade and commerce, finance, labor, etc. The objects, formation, and value of such a council to industry are worthy of the most careful consideration.

Gentlemen, I believe you are all ready and able to take your part in the education of the industrial worker, and I hope your society may give consideration to the proposals I have made.

Electrification of Canada's Railways

By John Murphy*

Note.—The writer wishes to acknowledge his indebtedness and to publicly return his thanks to officials of the railways below mentioned and of the manufacturers of the apparatus referred to, as well as to the technical press from which much of the following material has been gleaned.

Still smarting from the sufferings of two successive winters' fuel shortages, caused by inadequate transportation facilities, we are foregathered to see what can and should be done to prevent, if possible, recurrences of such serious and trying experiences.

No argument is required, I think you will agree, to support the contention that eliminating the need for coal at a considerable distance from the mine is a greater measure of relief, and of truer conservation, than increasing mine production and thereby incidentally adding more load to the already overburdened railways. Reducing coal consumption automatically relieves or releases men and apparatus all along the route from the mine to the consumer—it also relieves the route itself from some of its congestion.

So eminent an authority as Mr. E. W. Rice, the President of the American Institute of Electrical Engineers, addressing that body in New York last month made the following statement:—

"It is really terrifying to realize that 25 per cent. of the total amount of coal which we are digging from the earth is burned to operate our steam railroads—and burned under such inefficient conditions that an average of at least six pounds of coal is required per horse-power-hour of work performed. The same amount of coal burned in a modern central power station would produce an equivalent of three times that amount of power in the motors of an electric locomotive, even including all the losses of generation and transmission from the power station to the locomotive."

Mr. Rice went on to say that 150,000,000 tons of coal, nearly 25 per cent., as he said, of all the coal mined in the United States, were consumed in steam locomotives last year.

Here in Canada steam locomotives also did their bit, and consumed about 9,000,000 tons—30 per cent. of the 30,000,000 tons of coal imported into and mined in this country. Our 9,000,000 tons cover, I believe, wood and oil consumed on steam locomotives; some 49,000,000 gallons of oil are covered by the Canadian record. But in the United States' figures 40,000,000 barrels of oil, 15 per cent. of the total output, are not included.

The conservation of—the elimination of the necessity for mining—those great quantities of fuel would be secured if all the railways were operated electrically, and if the electrical energy were generated from water power. Modern steam central stations would save from 50 to 66 per cent. of the coal now used in steam locomotives if the latter were discarded and electric locomotives used instead.

With such possibilities for fuel conservation in sight may we not soon expect to learn that the fuel controllers in both countries have asked the railways, and that the railway managers have asked their engineers:—"How many of these millions of tons of coal can you save—when will the good work begin?"

It is said our fuel shortages were due to a combination of bad weather and inadequate transportation. As we cannot control the weather our attention and efforts must be directed to the transportation portion of the difficulty. Railway electrification will reduce coal consumption and haulage; it will also greatly improve traffic conditions; electrification, therefore, seems to be the solution of the problem. Under these circumstances it may not be out of place to recite in general terms what electrification has actually accomplished on some notable railways.

Railroading in the mountains is the most strenuous kind of railway work. The examples which I have chosen cover mountain sections. The Butte, Anaconda & Pacific Railroad, by electrification, increased its ton-mileage 35 per cent., and at the same time decreased the number of trains, and their incidental expenses, 25 per cent. The time per trip was decreased 27 per cent. It is said their savings in the first year's operation, after electrification, amounted to 20 per cent. of the total cost of electrification. They buy power from water power plants.

On the Norfolk & Western Railway power is obtained from their own steam station. Twelve electric locomotives have replaced 33 Mallets of the most modern and powerful type. The tonnage has been increased 50 per cent. Electrification obviated the necessity for double-tracking. The salvage value of the released steam engines was 45 per cent. of the cost of electrification. Electric locomotives make eight times as many miles-per-train-minute-delay as the steam engines. Their terminal lay-overs average 45 minutes, and they are double-crewed every 24 hours. Pusher engine crews have been reduced from 8 steam to 4 electric. Pusher engines or locomotives have been reduced from 7 steam to 2 electric. Steam locomotives used to "fall down" in cold weather—the electrics always "stand up," are really more efficient, in cold weather. At the New York Railroad Club meeting last year their electrical engineer stated that "coal wharves, spark pits, water tanks and pumps as well as roundhouses and turntables have all disappeared from the electric zone. Our track capacity has been doubled. Our operating costs have been reduced. From an engineering, an operating and a financial viewpoint our electrification has been a success."

Speaking of the value of the regenerative electric braking of their system he went on to say:—"The use of the air brake is practically eliminated, it is only used to stop trains; it is regrettable we are unable to put a dollars and cents value on this great asset; to appreciate it properly one must have had experience with the difficulties of handling 90 car trains with air." Another official, referring to the same subject, made the following statement:—"Trains of 103 cars are taken over the summit, 12 to 20 times every day, down the 2.4 per cent. grade without ever touching the air. We

*Chief Electrical Engineer, Department of Railways and Canals, Ottawa Ontario.

never broke a train in two or slid a wheel. It is done so easily we wouldn't spill a drop of water out of a glass in the caboose."

The 440 route miles of the Chicago, Milwaukee & St. Paul Railway which have been electrified will soon be augmented by 450 miles more. Nearly 900 route miles and about 33 per cent. in addition for passing tracks, yards, industrial tracks and sidings will soon represent the extent of this great railway electrification. Among the advantages secured by this railway on its electric sections are the following:—The cruising radius of each electric locomotive is twice that of the steam engine. Sub-divisional points, where freight crews and steam locomotives were formerly changed, have been abolished; the passenger crews' runs are now 220 miles instead of 110. For railway purposes these stations do not now exist; 7 or 8 miles of track have been taken up; through freights do not leave the main line track at all; shops and roundhouses have disappeared along with their staffs, and one electrician replaces the whole old force. An electric locomotive has made 9,052 miles in one month. Although schedules have been reduced the electrics have made up more than 2½ times as many minutes as steam engines—time which had been lost on other divisions; 29 per cent. of electric passenger trains made up time in this manner. On a mileage basis alone the operating costs of the electrics are less than one-half the steam engine costs. Freight traffic increased 40 per cent. shortly after electrification—double-tracking would have been necessary to handle such increased business under steam operation. An average increase of 22 per cent. in freight tonnage per train has taken place. One electric handles about 3½ times as many ton-miles as a steam engine; the reduction in time in handling a ton-mile is 30 per cent.; faster and heavier trains have accomplished these results, the number of trains has not been increased. About 11½ per cent. of the energy used by the railway is returned to the line in the process of regenerative braking, and this returned energy helps to haul other trains. While this is a very important item and reduces the power bills, it is only regarded by the management as of secondary importance in comparison with the more safe and easy operation of trains on the grades and the elimination of former delays for changing brake shoes and repairs to brake rigging when operating with steam locomotives. The electrics maintain their schedules much better than steam engines. In three months the electrics only waited for the right of way 254 minutes, while the steam engines in a similar period waited 1,910 minutes or 7½ times as long. Extra cars on trains only delayed electrics 1/9 of the time steam trains were delayed for a similar reason. Cold weather delayed steam trains 445 minutes in the three months under discussion, but the electrics were not delayed a minute; the latter are more efficient in cold weather. Many of the delayed steam trains were double-headers—never more than one electric is hitched to a passenger train. An entire suspension of freight service, due to steam engines losing their steaming capacity and freezing up was not an uncommon experience. Electrical energy for the operation of these trains costs considerably less than coal. This latter statement is one of the most interesting in connection with the operation of the C. M. & St. P. Ry. and it is especially interesting because it was made more than one year ago.

The limitations of the steam locomotive are due to the fact that it is a mobile steam power plant of very limited capacity; it is compelled to carry its own supply of coal and water, and it is unable to take advantage of many of the economical refinements of the large modern stationary steam plant. On the other hand, the electric locomotive has no such limitations; it merely acts as a connecting link between efficient gigantic stationary steam or water power plants and the train to which it is connected. The Electrical World summed up the situation a short time ago when it said:—"Why continue to haul millions of tons of coal, for and by uneconomical steam locomotives, all over the country, and thus add more loads to the already over-burdened railways, when the power which they need so badly can be much more economically and efficiently transmitted to electric locomotives over a wire the size of one's little finger?"

The continual increasing cost of coal and fuel oil will force railway managers to look more and more carefully into railway electrification. Estimates of a few years ago now need revision. Money may be hard to get, but, if at times fuel cannot be obtained at all, some substitute must be obtained if normal life is to be continued in northern latitudes.

A representative of the National City Bank of New York, writing of the period after the war, referred to the stagnation which may ensue in all the great industries now engaged in war work as soon as peace is declared; the multitude of people thus thrown out of work, in addition to the men of the returning armies, would create unbearable conditions unless suitable employment will have been arranged for them in advance; he referred to the economic advantages of railway electrification and was of opinion that this work might solve the whole question if soon taken up with vigor. The Minister of Public Works, Hon. F. B. Carvell, M.P., addressing the Ottawa branch of our organization a couple of weeks ago, spoke of the necessity of conserving the energy of our water powers—instead of letting them run to waste—so that this great store of energy might be employed in assisting to build up our own and to rebuild other countries when peace comes. How nicely these two ideas, water power development and railway electrification, work together if properly carried out?

With the view of securing something really worthy of presentation to this important meeting I recently wrote an eminent engineer, a man of international fame, and recognized as an authority on railway electrification, requesting him to tell me his own views upon this subject. A specialist's opinion, in my opinion, is always very valuable. Here is a short extract from his interesting reply. He said:—"Generalization is always dangerous, especially in connection with electrification of railways, where so many factors, such as the physical location, character of loads, the power situation, etc., come in to affect the decision if applied locally." From his sober statement it may be seen that my correspondent is an engineer—not a politician. He proceeded as follows:—". . . . with present equipment prices the cost is absolutely prohibitive." This opinion, let me point out, is in connection with the proposal to "electrify everything." Do not let it dampen our enthusiasm. Listen to this also and kindly keep it in mind; it is another extract from the address of Mr. E. V. Rice, above referred to. He said:—"I think we can demonstrate that there is no other way known to us by which the railroad problem facing the country can as quickly and as cheaply be solved as by electrification."

While the present fuel shortage questions have made us look to railway electrification for relief I feel such a project on a large scale can only follow or go hand in hand with power plant development and co-operative operation of power plants. The location of a number of plants at different points—large water power plants and auxiliary steam plants—so situated and inter-connected that a failure at one plant or the connections to it will not jeopardize the others or completely cut off and isolate an important railway district is, in my opinion, an essential feature in connection with any large railway electrification project.

The 99-year contract of the C. M. & St. P. Ry. is worthy

of more than a moment's attention and consideration in this discussion. That railway has a contract with a power company which has a series of plants stretching across the country parallel to the railway. The railway owns its substations and secondary lines but is not concerned with the high tension lines of power plants of the power company. A reasonable rate for power arranged between a willing purchaser and a willing seller—a contract in fact which each party knows the other will respect—is the basis and the real reason for that great railway electrification. Neither party questions the other's integrity or financial soundness. One delivers the power it has undertaken to supply and the other uses it. The arrangement is ideal in its simplicity and entirely satisfactory to everybody concerned. It will, in my opinion, be necessary to have such attractive power-supply situations as those outlined above, backed by abundant supplies of power, in order to foster and encourage early railway electrification work in this country.

Central Heating as Means of Conserving Fuel

By F. G. Clark*

Central heating is the replacement of two or more individual heating systems by one source of heat. The electric central station and the gas generating plant are illustrations of central heating to the extent that their respective forms of energy are used in connection with heating appliances. The use of electric energy and gas for this purpose is being dealt with in other papers which probably means that the writer is expected to deal only with steam heat distributed from a central generating plant. As the subject probably covers steam for power, providing it comes from a central plant, this enlargement will be made. We therefore have as our subject central steam plants as a means of conserving fuel by replacing isolated power and heating plants.

The relative merit of high versus low pressure systems has been the subject of much discussion. It appears that the high pressure systems were originally installed before electric energy became an important competitor of the steam engine. The central steam plant was generally able to substitute its service for the boilers of the consumer, and although the steam engine is no longer an important factor, the high pressure system remains in a number of large cities, and probably for the reason that the generating plants have high pressure boilers, and the street main cost of low pressure piping is high in comparison. The ideal system would take low pressure steam from a steam electric power plant. The steam would be taken from the low pressure stage of steam turbines through suitable regulating valves, and be superheated by a suitable heat exchanger before passing into the street mains.

The conditions which best suit this method of supplying heat, are a closely built up section of a city and a central location for the supply plant. The location of the station and the congested area usually gives a fan-like distribution system. As an economic proposition the central heating plant can offer to customers in a limited district a supply of heat for approximately what their coal would cost them, leaving a fair return on the central heating system investment. The purchaser of steam avoids the necessity of purchasing and operating boilers, saves the space they and the fuel would occupy and is free from the troubles of operation. Steam mains laid in city streets, while not entirely free from troubles, usually give ample warning of failure, and can be depended upon for continuous service.

The loss of heat is a more or less constant quantity, depending upon the length and size of pipe, its insulation, the difference in temperature of steam in the pipe and the surrounding earth, and the leaks. The nearer to capacity the mains are worked the smaller is the percentage of loss. A well-designed system, as for example, one covering that part of Toronto between the bay and College Street, and from Sherbourne Street to Spadina Avenue, if supplied from a central plant such as the Scott Street Station of the Toronto Electric Light Company, would be able to furnish all of the heat required in the district at a cost to the users from 10 to 30 per cent. less than their present expense. The saving in coal might be over 30 per cent., but in any case the cost of coal at the central plant would be sufficiently less than its cost delivered throughout the district to offset the fixed charges and heat losses of transmission through the streets.

On the assumption that 75 tons of anthracite at $9.00 a ton, and 150 tons of bituminous at $7.00 per ton is used in the district each week day for six months, and proportionately smaller quantities during the remainder of the year, the cost of steam under present conditions would be over $500,000 per year, of which the coal cost is about $400,000.

The central heating company would be willing to supply an equivalent quantity of heat for the cost of the coal, depending upon their own saving in coal and its cost to meet expenses and pay a dividend.

The conditions throughout Ontario and the populated parts of Quebec are ideal for the development of central heating plants because of cheap electric power, the number of heating days and the high price of coal. Every town of 10,000 or more inhabitants and with buildings not too widely scattered affords an opportunity for saving coal if it will support a well designed and well operated central heating plant. The smaller towns should depend upon hot water circulation, the water being heated during the hours when electric energy could be taken from steam engine units used to produce the exhaust steam needed for heating. The Hydro municipalities could use some of the energy they have been expending upon the radial railway scheme in the solution of this problem, and produce an economic saving of value to themselves and the country.

I would not care to make an estimate as to the saving that would result from a comprehensive establishment of central heating plants throughout the country. It is altogether improbable that any installations will be made in the immediate future. The idea of cheap hydro-electric power unlimited in quantity and in its capacity to replace coal has so taken hold of the people of Canada and of Ontario in particular, that they are simply waiting for the end of the war or the completion of the Chippewa development to heat their buildings electrically and thus entirely do away with coal. I will, however, venture one prediction which will have a considerable bearing on the question of central heating, or rather on heating in general. It is, that within ten years, gas and coal briquettes will replace the anthracite and bituminous coal now used and that the gas and the briquettes will be made from powdered coal sent from the mines to Hamilton or Toronto or London in pipes, just as oil is now pumped from Oklahama to the Atlantic Seaboard. The cost of the gas and the briquettes will be less than one-half and possibly one-fourth the present prices for gas and coal. What the situation with respect to the central heating will then be is left to your imagination.

*Chief Engineer, Toronto Power Company.

Transmission Line Practice—Construction and Costs—Article V.

By Lieut. E. T. Driver and E. V. Pannell

The chief problems of engineering at the present day are economic ones, and the achievements of the science are worthy of note only where a true economic problem has been solved. For instance, the development of a water-power some three or four hundred miles up-country, its transmission across unpeopled terrain, and delivery at a centre of commerce, whilst effecting a technical result, cannot be classed as an engineering achievement unless the same energy will turn the wheels of industry for a lower cost than any other means and still pay interest on the capital outlay involved. Power stations have been very highly developed along economic lines, substations still more so, and the main reason why energy which can be transmitted 200 miles cannot equally well be carried 500 is simply that the transmission line costs too much.

A careful study of the different factors of cost in transmission line work is, therefore, important, and the time when every motor will be turned, every lamp lighted, and every train operated by hydro-electric energy will arrive only when the cost of transmission lines, their construction and operation have been reduced to the minimum.

Briefly summarized, the main factors in the cost of transmission line are as follows:

1. Right of way—(a) Easements or purchase; (b) clearing.
2. Surveys and engineering.
3. Material—(a) Tower steel; (b) conductors and ground wire; (c) insulators; (d) hardware and equipment.
4. Labor—(a) Distributing material; (b) digging holes; (c) setting footings; (d) assembling; (e) erecting; (d) setting insulators; (e) stringing wire and cleaning up.
5. Interest.
6. Contingencies.

The right of way item is necessarily the most uncertain of all the cost factors; in some cases it has been the practice to

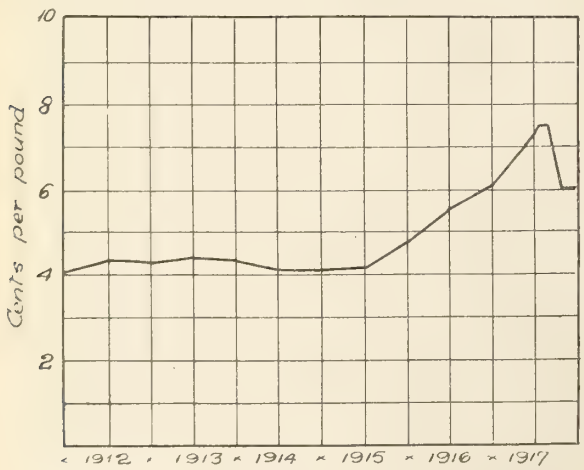

Fig. 16—Prices of galvanized steel shapes for towers during years 1912 to 1917

expropriate a strip of terrain from 50 to 100 feet in width for the whole length of the line. In the case of one very large transmission system in the South, an average of $11.42 per acre was paid for a 100 foot wide right of way for easements covering the right to erect towers and to patrol and maintain the line. This cost works out at about $15 per tower. In another similar system the cost of similar easements amounted to $1,200 per mile, which figure is also stated to cover the cost of surveys and engineering. Allowing the fairly representative figure of $500 per mile for these items, the actual cost of right of way and clearing amounts to the appreciable figure of about $700 per mile, or nearly $80 per tower. Between the above two examples most costs of right of way will be found to lie. Necessarily with the growing appreciation of the vital importance of cheap electric power it will become the regular practice for legislative assemblies to grant an act of eminent domain to all bona fide power transmission systems and to set a maximum price on land particularly where it is being held for the exploitation of the power company. The item for clearing will generally be inversely as that for easements, be-

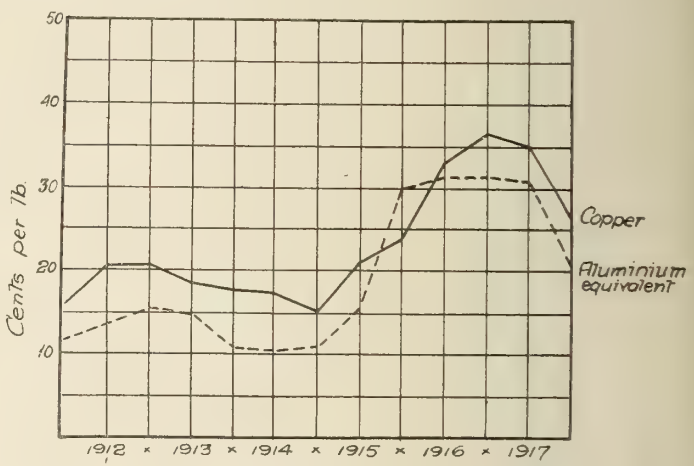

Fig. 17—Prices of copper transmission cable during the years 1912 to 1917

cause the most costly right of way will be that across cleared and cultivated country.

Surveys of the kind necessarily for power transmission lines are frequently effected at a cost of $100 per mile or less, whilst subsequent engineering expenses account for about $400 per mile. Naturally much depends upon the extent of the system, its accessibility and the type of country. It will in most cases be found that these figures are upon the high side As in every other kind of field work, a careful and perhaps costly survey may save several hundred dollars per mile on subsequent operations.

Turning now to the item for material, the most important is perhaps tower steel. The market prices of small galvanized steel shapes of the kind used for transmission towers, cut and punched in 500-ton lots, have varied somewhat according to the curves in Fig. 16. A great diversity of shapes in the required tonnage would, of course, involve still higher prices than these, together with more protracted deliveries. The difficulties in respect of steel, together with copper and aluminium, have been not only the prices, but the scarcity, of metal, and the congested state of the mills. Figures 17 and 18 show the price tendencies in copper and aluminium conductor cables during the last six years, and provide sufficient evidence that an increase in power rates is necessary if hydro-electric energy is still to be generated and transmitted.

In the early days of the war it was customary to speak of the time when prices would return to "normal" levels. This unsound economic argument has since been exploded, not, however, before scores of important engineering projects had been postponed awaiting the return to "normal" prices. Briefly, the cheapening of the gold standard has appreciated

every raw commodity by 100, and the condition will probably obtain, with minor market fluctuations, for the next half century.

Similar comments apply to the situation as regards labor and construction costs, with the qualification that in this case economies of considerable magnitude can be effected by careful organization. It is a matter of experience that the construction costs for the extensions to a transmission system are ceteris paribus lower than those for the initial undertaking, and, with the collection of actual working data, the unforeseen elements can be reduced to a minimum and costs also diminished. The seven items of cost in the "labor" category for six different transmission lines aggregated as follows:

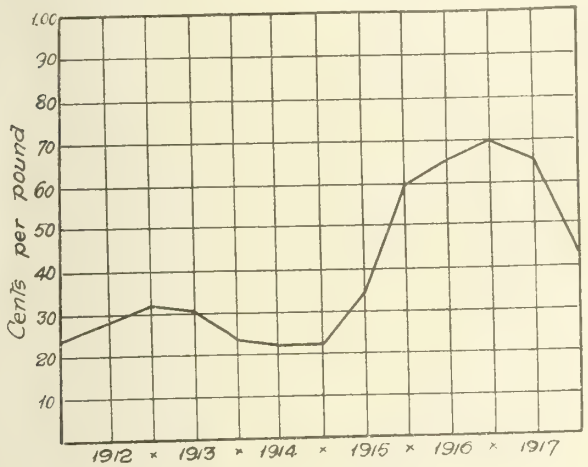

Fig. 18—Prices of aluminium transmission cable during the years 1912 to 1917

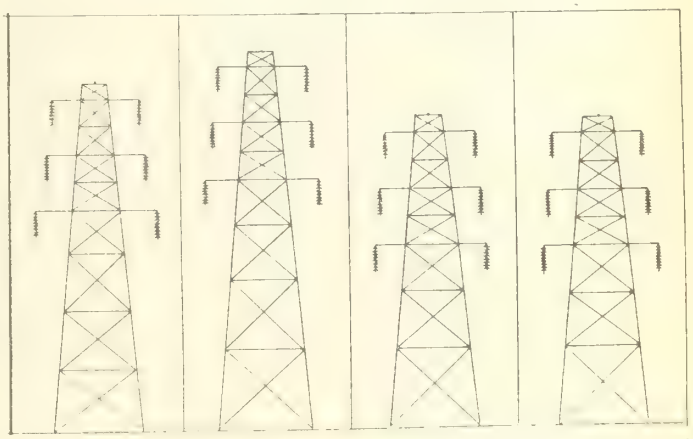
	Per tower.
System No. 1	$30.00
System No. 2	42.25
System No. 3	79.39
System No. 4	54.81
System No. 5	59.24
System No. 6	67.60
Average	$55.55

System No. 3 was over very unfavorable country, with considerable guying for angles. It would be found at the present time, however, that this figure is not far short of being representative, and that $80 per tower is not an unreasonable estimate for the construction costs associated with wire are included in this. The actual tower construction costs a 4,000-pound structure. Hanging insulators and stringing are estimated as follows:

Cost of tower steel, galvanized, punched, and bundled, per pound		7.000 cents
Cost of distribution	.20 cents	
Cost of digging holes	.35	
Cost of setting footings	.25	
Cost of assembling	.40	
Cost of erecting	.30	
		1.500
Total cost of tower erected, per pound		8½ cents



These items, it will be seen, are all dependent upon the quantity of material to be handled, and are, therefore, best expressed as a function of the net weight of the tower steel involved in the line. Setting insulators and stringing cables and ground wires are expressed by a fairly constant figure per tower:

Hanging insulators, per tower	$ 6.00
Stringing wire and cleaning up, per tower	15.00

All the above figures have been arrived at by a study of a large number of 100,000-volt installations using double circuit three cross-arm towers, spaced about 8 to 10 per mile. No intention is implied, however, to do more than merely outline the method of estimating, because the adoption of published figures for serious work would be disastrous.

For the purposes of this article interest during construction is assumed at 5 per cent. of the total cost of material and and labor, and contingencies may be considered fully taken care of by an equal allowance. Necessarily the first item will depend upon the time occupied between the placing of the first contracts for material and the first supply of power over the line. It will be lower where the line is short and where construction work can go ahead all the year round. The contingencies item amounts to a safety factor to cover work not anticipated under the heading of surveys or engineering.

It will be interesting to investigate the estimated costs of material for a twin-circuit transmission line carrying 50,000 kw. at 110,000 volts, 60 cycles, and to consider particularly the alternative use of different conductor materials. The size of cable will be 4/0 B&S copper, and the equivalent size in aluminium, aluminium-steel, and copper-clad steel. In Fig. 19 have been worked out the towers for these four cables on a 600-foot span. It will be seen that the total weight of steel per mile is not very different for copper or aluminium, but is appreciably more for aluminium-steel, and reaches a prohibitive quantity in the case of copper-clad steel. The reason is that these two latter conductors are not being economically employed at a span of 600 feet, and if these cables were all compared on the basis of 1,000-foot spans the higher tensile conductors would show up more favorably. However, in view of the fact that copper-clad calls for nearly the same height of tower as aluminium-steel, whilst the tension along the line is twice as great, the towers for copper-clad will always cost about double those for aluminium steel. If there were any saving on the conductor material itself to balance

Conductors.	Copper.	Aluminium.	Aluminium-steel.	Copper-clad steel.
Size, equivalent	4/0	4/0	4/0	4/0
Maximum sag, feet	14.4	20.4	8.2	7.6
Tower height, feet	62.4	68.4	56.2	55.6
Horizontal load, pounds	15,000	10,500	26,600	48,600
Weight, standard tower	4,700	4,150	6,700	12,300
Weight, special	7,050	6,210	10,000	18,400
Span, feet	600	600	600	600
Total steel per mile	49,400	43,600	70,400	129,500
Unit price erected, cents	8½	8½	8½	8½
Total cost per mile, dollars	4,200	3,700	5,980	11,000

Fig. 19—Towers for a 600-foot span with different conductors

this inequality there might still be a good case for copper-clad for regular transmission work across country, but, unfortunately, the cost of this type of cable is higher than any other. It must, therefore, be considered economically unsuited for the purpose, except in the case of special river crossing spans or any locations where the conductance is of little or no importance so that a relatively small conductor can be selected.

The average span of transmission systems ten years ago was in the vicinity of 400 feet. This value has gradually extended until the majority of long-distance systems are now

being constructed, with spans of 750 to 800 feet, in favorable country. This tendency is dictating the use of materials of higher tensile strength, such as aluminium-steel, which, with the relatively small sag, call for a short tower. The tower will, of course, be heavier for its height than a structure for copper or aluminium cables, but with long spans it will be found that the net weight of steel will be less.

Turning from materials to methods of construction it should be mentioned that the above tower costs are based upon earth stubs. In other words each tower leg is bolted to a heavy angle member, extending some six or seven feet into the ground and terminating in a steel grillage. As a standard footing this arrangement is used with success on the majority of the high tension lines now in operation. Where bad ground is encountered, however, the concrete footing is necessary, and the same applies to crossing towers, and where any doubts exist as to the nature of the ground, to angle and dead-end towers also. In a few instances a complete tower line has been set with concrete footings, but this extra cost (usually of the order of $100 per tower) is very seldom necessary if the possibilities of a well-designed earth stub are carefully considered.

Stringing wire is a rapid process in good country where a team can be employed, but is more troublesome with only manual labor. It is customary to provide the foreman of the stringing gang with a table of sags, and these are sometimes worked to, to the exclusion of the dynamometer. Now, although it is important to string with the correct sag, the dynamometer should not be neglected, because it affords an opportunity to take the flexibility out of the cable by pulling right up to the elastic limit and then letting it gradually down to the required tension. It is certain that if this practice were regularly followed out there would be less need for re-stringing lines.

Canadian Railways Using Women Conductors

As the difficulty increases of keeping male employees as electric railway conductors, Canadian roads will doubtless find it necessary to substitute women for this work. In certain localities conditions, of course, are not favorable, but in others the experiment has proved very successful. One example is that of the Nova Scotia Tramways and Power Company, who are employing something over 20 women conductors at the present time. Regarding their efficiency, Mr. H. R. Mallison, managing director of the company, writes as follows:

"We have approximately 22 women working as conductors, and their services are what might be termed reasonably satisfactory. We have had them employed in this capacity long enough to be able to judge as to their ability, and we firmly believe that if the women are desirous of doing the work, and will take the proper interest therein there is no doubt that they can discharge the duties fully as efficiently as the average man. Amongst the women employed by this company there are six or seven whom we consider as efficient in every respect as any of the men we employ.

"I am under the impression that at the outset a number of the women who took up the work did so without realizing the difficulties of the position, and during the severe winter weather they were physically unfit to stand the strain; others took up the work more in the nature of a lark, and were careless and negligent in the performance of their duties, indulging in a great deal of skylarking with passengers on the cars, and, as a result, were dismissed within a short time. Difficulty was also experienced in impressing upon a number of the women the absolute necessity of being on time to take over the cars and of advising the car starters of their inability to return for duty. With those who remain in the employ at the present time the majorty of these difficulties have been overcome, and, as I before stated, we find some of them are equally as efficient and reliable as the men, and with others the main difficulty is their physical inability to handle the work. I believe that, with the improved weather conditions, the difficulty in this direction will be very considerably removed, and that we shall have as much satisfaction from the employment of women conductors as we have from the employment of men."

B. C. E. R. Co. After Domestic Business

In our last issue we described the plan of campaign of the city of Winnipeg electrical department to place more household equipment. The British Columbia Electric Railway Co. also started their campaign for the sale of electrical appliances early this spring. In the week commencing January 15 they put on an electric washing machine campaign, and gave daily demonstrations at their main salesroom; also one of the electrical dealers demonstrated the machines in his windows. The company's four outside selling agents followed up the prospects obtained at the demonstrations and also made house-to-house canvass in the better class districts, with the result that they sold six machines during the week and fourteen more since then—nearly $3,000 worth of business in washing machines already this year. They have also this year featured suction cleaners and electric ranges in their advertising and solicitation, with very good results. Outside agents are paid on a salary plus commission basis.

We print below copy of a letter which was mailed two or three days before the agent's call during the summer months last year, and which resulted in excellent business in grill-stoves in districts where gas for cooking was not available. The agents found that they were given a chance to demonstrate the appliance in nearly every case, and state that the results of a house-to-house canvass can be greatly increased by such a letter at very little additional cost. The campaign was under the supervision of Mr. Edmund E. Walker, sales engineer.

Letter Preceding Agent's Call

Dear Madam:

Within the next 3 Days our representative will be in your neighborhood demonstrating in the homes of our consumers a most useful household appliance known as the Electric Grill-stove.

Your name is included on his list, and we hope you will make it convenient to grant him a few minutes of your time.

He will explain the indispensable uses to which this electric table stove can be put. You will be surprised when you see how easy it is to execute small cooking operations. How, in fact, the whole of your cooking can be done quickly and in an entertaining manner should guests call to see you.

He will also tell you about our easy payment plan, whereby you can own one of these appliances with a very small immediate cash outlay.

We feel sure you will find the demonstration an interesting one, and take this opportunity of thanking you in anticipation for granting a short interview.

Your truly,

Edmund E. Walker,
Sales Engineer.

Canadian Electrical Association Meeting

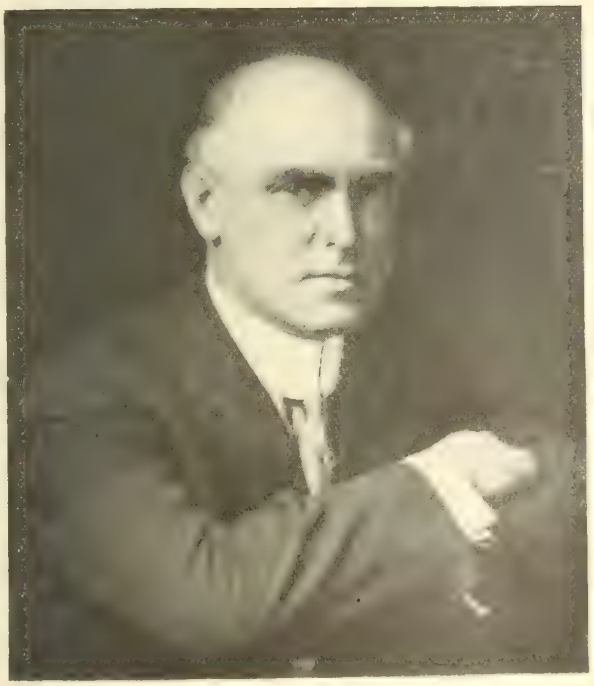
The Managing Committee of the Canadian Electrical Association have decided that their annual meeting this year shall take the form of a one-day strictly-business session, to be held some time during the latter half of June. It has not been settled whether the meeting will be held in Quebec, Ottawa, or Toronto, but this will be determined within the next few days by a letter vote of the members of the association.

Teach Children to Respect Dangling Wires

Winnipeg, Man., April 19, 1918.

Editor Electrical News:

I have read with much interest your comments on your correspondent's suggestion as to advisability of teaching children in the public schools the necessity of refraining from touching any wires dangling in the streets. I have passed this along to Dr. McIntyre, superintendent of the Winnipeg Public Schools Board, urging him to endeavor to carry this out. We have in the past had regrettable instances of the danger of touching broken wires in this city. In some cases these have resulted in fatalities, and the wonder is that a larger number of fatal accidents have not taken place, as I know personally of quite a few instances where 2,200-volt wires have been burnt off and have been found hanging in the streets, and constables and other officials of the city have attempted to handle these, with the very best intentions, no doubt, but with miraculous escape from receiving serious shocks. I trust that your suggestion will meet with general approval, and that it will be carried out in a practical manner. I am,



Yours truly,

F. A. Cambridge,

City Electrician.

Packard Electric Changes

A change in the management of the Packard Electric Company, Ltd., St. Catharines, Ont., has taken place during the past month. Mr. George C. Rough, who has been secretary and sales manager of the company for a number of years, has been elected president, and their chief engineer, Mr.

Mr. George C. Rough

Frank T. Wyman, vice-president, both to act as joint managers of the company.

Mr. R. B. Hamilton, who has been president and managing director, has been relieved of his duties in order that he may devote his entire time and attention to war contracts in connection with the Packard Fuse Company, Ltd.

Plans are in progress for a new distributing station for the city of Sherbrooke, Que.

The Montreal Tramways Commission

Prof. L. A. Herdt, of McGill University, electrical engineer; Mr. John S. Archibald, architect, and Judge St. Cyr, of the Court of Sessions, have been appointed members of the Montreal Tramways Commission. Prof. Herdt was the consulting expert of the original commission which enquired into the conditions which resulted in a new agreement for a fresh franchise being concluded between the Tramways Company and the city, and he was also a member of the valuation committee of the commission which fixed the capital value of the company. He is a member of the electrical commission which has the charge of designing and constructing the civic conduits.

The new contract is for 35 years, and the commission has jurisdiction over all the company's lines or any of its subsidiaries, so far as finances, operation, extension, and disputes are concerned. The powers are very extensive, and cover the entire range of the company's working, financial as well as the operating end. One of the first subjects to be discussed will be that of fares, which can be modified by the commissioners.

The members of the commision are appointed for ten-year terms, but can be removed by the Lieutenant-Governor-in-Council for cause, and either the company or city of Montreal can demand the removal of any commissioner for fraud, corruption, and refusal to fulfill in good faith his duty, by means of quo warranto proceedings.

Promoting Better Relations with the Public

In its desire to promote good relations with the public and effect a clearer understanding of the utility problems, the Winnipeg Electric Railway Company has established a publicity department which will be under the direction of H. C. Howard, formerly on the staff of the Winnipeg Free Press. In connection with this publicity department it is the intention of the company to issue a publication which will take the form of a pamphlet, and distribute same, as regularly as they are published, through the medium of the street cars. This publication will provide a closer and more direct means of communication between the company and its patrons, and it is expected will be instrumental in improving relations between the company and the employees, helping them in the discharge of their difficult duties to the public. Matters of public interest will be discussed in the columns of the paper, and from the frank talks which will appear therein from time to time it is expected a greater degree of confidence and good-will between the company, its employees, and the public will be attained.

The Problem of Service

Mr. A. O. Dawson, vice-president and general manager of the Canadian Cottons Company, Ltd., was the speaker at the Montreal electrical luncheon on April 10. His talk, on "The Problem of Service," was a consideration of the duty of service to our fellow-men, involving sacrifice of life, time, and wealth. All progress, he remarked, was accompanied by the sacrifice of men. The only method by which men could get away from self-centered living was by sacrifice, and the only way by which they could develop their better selves was by serving others. The men who thus served their fellows must exercise patience, and must not be surprised if their efforts were not always appreciated. In commenting on the war, Mr. Dawson said that the time might come when Germany would recognize that the Allies were serving Germany by this conflict. There would never be peace in this world until the nations got together in the spirit of helping one another, and not with the idea of crushing nations. The spirit of service engendered a feeling of optimism and brought joy into the lives of those who served as well as those who benefited.

The Dealer and Contractor

A Letter from the "Field"—Mr. Rufus Earle with the Army in France Describes Some of His Experiences

Our Toronto electrical-contractor readers and many others throughout the province will be glad to know that Mr. Rufus Earle, one-time secretary of the Toronto Electrical Contractors' Association, has gone through two years of useful experience in Europe and is still hale and happy. Mr. Earle, it will be remembered, left Canada with Colonel S. S. Sharpe's regiment. Apparently he was having an hour or two off duty on March 10 last, and possibly was a little bit homesick, for on that date he wrote his brother Gordon a long and most interesting letter, which we are privileged to reproduce, in part, below. In one place he says: "Mail from home is eagerly looked forward to, and if you only realized how much the news about friends in Canada is appreciated and the news about what is going on, I am sure that everyone would write more frequently." Now, can't you, friend reader, spare him a half-hour of your pen and ink? The following are the extracts from his letter:

"In the Field, March 10, 1918.

"The last few days the weather has been glorious, and quite warm, but, of course, we must expect some bad weather yet. I was at the Vimy Ridge scrap on April 9, last year, and the weather for two or three days before and on the Easter Monday morning, when the attack was launched, and for a couple of days afterwards, was terrible—cold, with sleet, snow, and rain. The morning of the attack however, the gods were with us, and the heavy sleet storm was blowing right in Fritz's face. He had been expecting the attack every morning for about three weeks, and had been standing-to every morning; but on Easter Monday, when his lookouts saw the weather condition they must have decided that there would be no attack that day, and gone back to bed, because he was taken completely by surprise. All through March, and until about the 15th of April, 1917, the weather was very cold, but, following that, it was beautiful. The fall of the year is also beastly weather. I was at the scrap at Passchendaele Ridge, before Ypres, in Belgium, in October and November, 1917, and the rain was almost incessant, and the roads and paths almost impassable. "Duck-boards," or latticed sidewalks, had to be laid on the ground to facilitate the passage of the troops, the rations, and the ammunition up to the line. I have actually seen a mule track through the mud made of 9.2 in. howitzer shells (unexploded ammunition), laid on their sides, and forming a corduroy road, over which the pack animals walked. Lord knows what a shell of that size costs, but it is the biggest gun outside of the big long-range guns situated away back.

"My trip to Paris was the experience of a lifetime, and I only want to see more of this country before the opening of another new year. To take the fourteen days' leave, which is the period now, requires about 1,000 francs, and I have not nearly that much on my pay book. Prices have gone up tremendously over here. Rooms at hotels are remarkably cheap, and you can get really first-class accommodation for from 6 to 7 francs a night (roughly, 20c to a franc), but food is very expensive; also tobacco, etc. For leave in France you have to pay your own fare on the railways after you leave the zone of the armies, but the fare for soldiers is remarkably cheap. The military travel third-class, and the fare for a man in uniform, whether French or allied, is about 5 centimes a mile, or about ½ cent. Coming back from Paris to Amiens we slipped it over their eye, and bought first-class military tickets. I do not know what the distance is, but we rode first-class on a fast train from 11.40 p.m. to 4.44 a.m. for 3 francs 40 centimes each, or about 63c each. The rate for civilians, however, is not cheap.

"The Bosche bombing planes were over our vicinity last night and the night before, for the first time in about three weeks, but they did not come anywhere near us. There is no moon at the present time; the new moon doesn't start until the 12th. I suppose we will have him back as soon as the bright moonlight nights come again. I never mind him as long as I am in company or in bed. However, I have to work every night until about 9 o'clock, and when the moon rises early and I am alone in the office and busy when he comes over, it is not very pleasant. However, it is all in the game, and the chances of him hitting are very small. He came near enough one night about three weeks ago to let us see the upheaval caused by the explosion of the bombs in an adjacent field, and to hear the bombs swishing down through the darkness. However, when he gets that close they generally get the searchlights focussed on him and then start at him with the "Archies" (anti-aircraft guns) and the machine guns, which generally turn him away from us. The heavy 60-pound aerial bomb is a fearsome thing, and does tremendous damage. There have been casualties in camps on both sides of us, but up to the moment we have escaped scot-free. We have an aerodrome right alongside our camp, which attracts his attention. Yesterday one of the planes came in and made a safe landing, after having been riddled with machin-gun bullets through the body of the car, the propeller and the tail, and after the pilot had received three bad leg wounds. I hear that it was brought in by the observer. They had been attacked in the air by eight Bosche planes, and, after bringing one of the Bosche down, had to run for it, and escaped in comparative safety. It was a smart piece of work. Another chap came back yesterday. He was 40 miles away from the drome and 20,000 feet in the air when his engine gave out, and he was forced to plane for it, with his engine just running by fits and starts, and for some considerable intervals he was without the engine at all, and he got home, making a perfect landing. To-day, being a fine day, the air has been full of planes all day. I couldn't sleep in my tent this afternoon for the constant roar of their engines. The half of this war will never be told.

"I often think that I would like to be home again, recounting some of my experiences out here, and the things I have seen, but some are so horrible that they are best forgotten. Of course, there is always the humorous side, and a sense of humor is a saving grace out here. One of the

strong points on Vimy Ridge held by the Germans was La Folie Wood. You have no doubt read and will remember the names of the strong points held in that battle which cost so many Canadian lives—'La Folie Wood,' 'La Folie Farme,' 'Ecole Commune,' 'Bois de Chaudiere,' etc. 'Folie' Wood is contracted by the Canadian Tommy to 'Foley's Wood,' and a chap said in our battalion one day when we were going over the ridge to go in the line, which was at that time about three miles in advance of the ridge: 'I have one ambition in life, and that is to see old man Foley come back and try and run that farm.' When you remember that the craters made by our heavies are so close that the lips run into each other; that the whole area is covered with ruined cement machine-gun posts and barbed wire, twisted iron, and that tons of unexploded explosives lie beneath the surface of the ground in 'dud' shells, you will realize the humor of the saying. That is one of the mysteries out here. Where are all these people whose names are so familiarly used by us every day in speaking of farms, houses, etc.? Can you imagine them coming back to these scenes of desolation where once they lived and labored at peace, and to the homes where they were, possibly, born and educated? It is pathetic to see civilians come back to a ruined town after this is made possible by a British advance. It is also pathetic to see with what tenacity some cling on to their homes and little shops and estaminets, even under heavy shell fire, and will not leave. You see houses still unoccupied without a pane of glass, the window frames being filled with sand bags to protect the inmates against flying bits of shrapnel and shell casing—houses where every night the owners sleep in the cellar, and where they take refuge in the cellar every time the shelling starts, and still they refuse to move. I have seen farming going on under shell fire, the peasant—and sometimes it is a woman—calmly driving the plow, apparently oblivious to all else but the duties of getting in the crop.

"In a little village at which we were billeted near Lens some time last year, myself, our regimental quartermaster-sergeant, the company sergeant-major of 'D' Company, and one or two others, were sitting in the kitchen of an estaminet having a bottle of white wine, when a Bosche heavy shell whizzed up a nearby lane and exploded about four or five hundred yards back of us. The old man and the old woman immediately beat for the cellar, and the daughter followed them in the rear, bearing a lamp and the cash box, and left us all sitting there. The desolation in France that I have seen, however, is as nothing compared to the horror of Belgium. The destruction of Ypres is indescribable. By the way, while I was up in Belgium I saw the famous White Chateau, where the notorious Von Bissing used to live at one time. Belgium is well named the graveyard of the Canadians, and we left some of our best boys there, but the Canadians made history there, when others had failed. War, as it is played out here, is a very modern and up-to-date institution. Within fifty yards of where I sit is a cinema theatre, which will seat 500, and which runs two shows every night, Sundays included. This afternoon—Sunday—there was a boxing tournament held there. A few hundred yards more down the road is another theatre of about the same size, where a concert party of about 30 members is putting on shows nightly. The battalion has started work on their farm, and have every promise of lots of fresh vegetables this summer, if we are not rudely disturbed by the Hun, while some of the officers have had bulbs planted around their huts, between the outer wall of the hut and the 4-in. wall of sandbags which surrounds it, the intervening space being filled with earth, which forms the garden. Football matches are played by neighboring imperial troops on our front lawn almost daily. Do not imagine that the troops are badly fed. Our menu for to-day, which is a fair sample of what we get in mess regularly, was: Breakfast—Porridge, bacon and egg, toast, marmalade, and tea. Dinner—Roast beef, mashed potatoes, cauliflower, rice pudding, and tea. Supper—Boiled ham, mashed potatoes, pie, and tea. Such things as condensed milk, sugar, margarine, and butter, which are very scarce in England, are well supplied to the troops. Of course, this is the sergeants' mess, where a considerable amount is expended in extra rations each month, but the men fare well, also—much better than could be expected."

Toronto Electrical Contractors' Association—Don't Miss the May Meeting—Important Matters are Coming Up

The monthly meeting of the Toronto Electrical Contractors' Association, held in the Walker House on April 4, was one of the most successful of the year. President McIntyre, who has just returned from a meeting of the National Association executive in Detroit, announced that arrangements had been concluded with the National Association of Electrical Contractors and Dealers whereby the Toronto association could purchase certain of their data sheets for distribution among the members. Mr. W. C. Peet, chairman of the National Association, was very cordial in extending an offer of co-operation.

A letter was read from the secretary of the British Columbia Association of Electrical Contractors and Dealers with particular regard to the affiliation of Canadian associations with the new National Association. This question is being followed very closely by the officials of the Toronto Electrical Contractors' Association. Mr. McIntyre, just having returned from the National Executive Committee meeting at Detroit, spoke at some length on the Goodwin plan, reading the definition of the Goodwin plan, with comments, laying particular stress on the fact that the movement is now under way, and that it is being continued, principally through trade journals and trade organizations, and noting the various statements as to individual and organization responsibility in the industry. The Goodwin plan, which was fully outlined in the Electrical News of December 1 and December 15, 1917, is, briefly, as follows:

THE GOODWIN PLAN

A campaign of education, conducted principally through trade papers, trade organizations, and other channels, to co-ordinate the various interests in the electrical industry, and to bring them together in harmonious action so that there may be established retail distribution of electrical materials at fair prices to the consumers, and with a fair profit to all parties taking part in the transaction.

Mr. McIntyre pointed out that since it is becoming generally recognized that the "ills of the industry" lie outside the circle of any one organization or of any one locality, therefore it would seem that a corrective movement must be national and, in fact, international in scope, so far as Canada and the United States are concerned.

Frequent calls for expressions of opinion by the members were met with unanimous and enthusiastic response, definitely showing that this is just what the local contractors and dealers need and just what they want. The General Electric Company has been asked to supply 150 copies of the booklet, "The Bridge," which will be distributed to members and to others of the local branches of the industry.

In response to a telegram from President McIntyre, a telegraphic message from Mr. William L. Goodwin to the meeting was read: "Best wishes successful meeting Toronto local contractors' association. Trust information gained at Detroit meeting will enable you to direct the energies of your

association along a line which will result in the benefit of members. Shall be pleased to lend my assistance."

A message of thanks to Mr. Goodwin for his offer of assistance was proposed and an official invitation extended to him to come to Toronto at the first opportunity to help along the movement in this district. Definite steps in this direction are being taken.

A notice of an amendment to the constitution was received which will separate the offices of the secretary-treasurer and provide for three members at large of the executive committee, making the executive committee seven in number. This change in the organization should result beneficially.

It has been reported that the Hydro-Electric Power Commission electrical inspection department will discontinue electrical inspection in the Northern Ontario district, and the president was authorized to take up this matter with the commission, to the end that no discrimination regarding inspection be allowed in different parts of the provnce, and that there should be no laxity in the requirements.

The question of licensing has been dropped for the present, as the Toronto Electrical Contractors' Association is opposed to any local law. The policy of the association as adopted will lead up to an endeavor to obtain a provincial act at the next session of the legislature.

The labor question was discussed at great length, and a general advance to the men was conceded as only fair. The negotiations with the men have proceeded during the time that has elapsed since the meeting of April 4, and a settlement has now been reached which will be announced at the next meeting.

The question of having a chartered accountant as auditor was taken up, and, upon the recommendation of the president, was adopted unanimously. It is desired to maintain a strict business policy concerning the funds of the association, and this is undoubtedly a step in the proper direction.

Nominations for Officers

Mr. Kenneth A. McIntyre was nominated for president and the nominations immediately and unanimously were voted closed. Mr. Harry Hicks, for vice-president, was accorded the same treatment.

The nominations for secretary and treasurer were deferred until the next meeting—May 2—owing to the proposed separation of these offices. Mr. E. A. Drury was nominated for the executive committee, and further nominations will be made at the next meeting, when the elections are to be held.

Ring binders for use in preserving the data sheets to be issued by the association were distributed to the members, at a price of $1.30 each.

It is the intention of the association not only to distribute the blue data sheets of the National association, but also to get out special sheets of local interest from time to time.

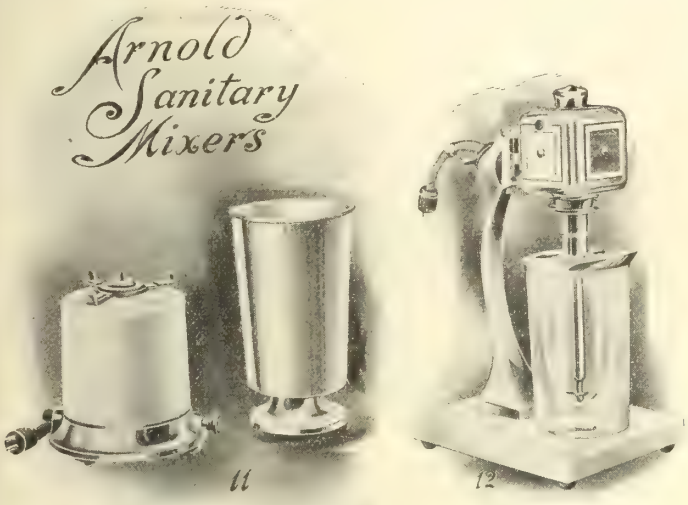
The next meeting is at the Walker House, May 2, at 7.30 p.m. sharp, at which the elections are to be held and the complete report given on the wage negotiations with the men.

Westmount Made a Good Showing

In the annual report of the city of Westmount, P.Q., signed by Mr. George W. Thompson, general manager, reference is made to the results of the electric light department for the year ending October 31, 1917. The total earnings were $150,563.23, of which $134,797 were derived from electric current sold, $13,210 from electric supplies sold, and $2,513 from rental of conduits. Operating expenses totalled $90,459, and, after deducting bond interest, sinking fund, etc., and reserving $22,084 for depreciation, a net profit of $18,603 is left. The report states that at the opening of the year the department was faced with an increased cost in operating. It was, therefore, quite evident that if the usual good showing was to be maintained it would be necessary to secure new business. That this was accomplished is evidenced by the increased output of 13 per cent. The electric cooking has proved a great success for the department, as well as for the user. One hundred ranges have been installed. The laying of underground conduits was only carried on in the lanes that were being permanently paved.

The Bell Telephone Company has continued the work of placing their wires underground and the removal of the poles and wires from the streets. The destructor plant has continued to give excellent results. During the year 17,639 tons of household refuse and 383 domestic animals have been consumed therein. The health department has been given a credit of $8,338 for heat value of refuse consumed.

The Clemens Electrical Corporation



The Clemens Electrical Corporation of Canada, Hamilton, Ont., have placed on the market a new electric soldering outfit which is claimed to revolutionize the method of soldering. These tools, made in several sizes, are known commercially as the "J. C." tools. They differ from others, in that the current does not flow until the twin terminal touches the work to be heated. The terminals are of carbon, which almost immediately develops a very high temperature—up to 3,300 degrees C. As soon as the operation is completed and the tool taken from the work the current, of course, ceases to flow, as the circuit is open. The same company manufacture a copper-pointed iron which is heated on the same principle—that is, the circuit is closed by allowing the iron, operated by a spring, to come in contact with the two carbon points. When this contact has been made it is said to take less than a minute to heat the copper ready for work. This iron can also be used as a two-prong soldering tool by simply removing the tip. These tools are practically fool-proof, in that there is nothing to burn out and that the only parts requirng to be renewed are the carbon contacts. The company has distributed an attractive booklet which illustrates and describes their equipment.

Trade Consolidation

An interesting example of after-war trade organization in the engineering industry is shown by the well-known firm of Dick, Kerr & Co., Ltd., the development of whose business organization during the war has been such as to place this firm in an exceedingly strong position. For many years past Dick, Kerr & Co. have occupied a leading position as contractors for the construction and equipment of electric railways and tramways, waterworks, factories, etc., with a general engineering works at Kilmarnock and large works at Preston for the manufacture of steam turbines, electrical machnery, and electric lamps. Recently they have also taken over the control successively of the old-established business of Willans & Robinson, Ltd., of Rugby, well known as builders of steam turbines and Diesel engines, and of the United Electric Car Company, Ltd., of Preston, prominent manufacturers of railway and tramway rolling stock; and, in addition, have completed a joint manufacturing and selling arrangement with the Phoenix Dynamo Manufacturing Company, Ltd., of Bradford, in regard to certain classes of standardized electrical machinery. One effect of this unique combination of engineering interests is that while the combined technical and manufacturing knowledge of the associated firms will be available for all, yet each works can confine its output to those products for which it is best equipped. Under centralized direction the Dick, Kerr organization, with its extensive home and foreign connection will be available for the associated businesses, to the evident advantage of all. Some idea of the magnitude of the combined undertaking may be gathered from the fact that, roughly, 20,000 people are employed by the firm to-day.

The "Sanitary" Mixer

The illustration herewith shows the Arnold Sanitary Mixer now being distrbuted in Canada by R. E. T. Pringle, Ltd. In addition to the claim that it is clean and sanitary, it is said that it will mix drinks in one-third of the time required by any other machine; that none of the contents of the vessel is ever spattered about, and that the ingredients are more

thoroughly mixed—none adhering to the sides of the glass. On this account it is claimed that the Arnold will pay for itself in economies effected.

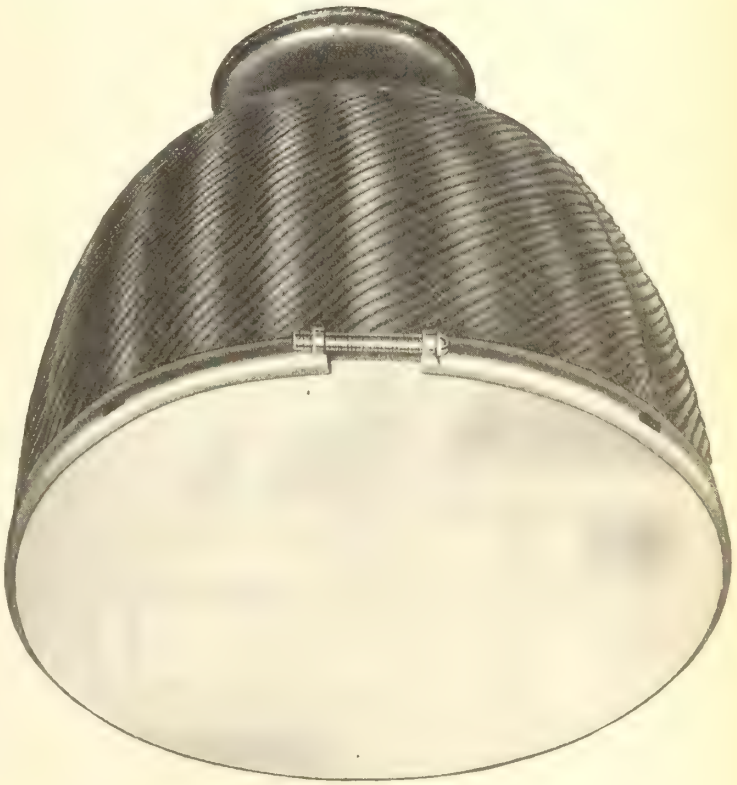
A Heavy Duty Plug

Harvey Hubbell, Inc., have designed the heavy duty polarized attachment plug illustrated herewith, which is intended to be used interchangeably with the Hubbell line of

heavy duty polarized wall and flush receptacles. It is rated at 660 watts, 250 volts. The base is constructed of porcelain and the cap is brass covered for protection against breakage. The knife blade contacts are strongly constructed, the blades being at right angles to each other to effect polarization, making the plug desirable for use in connection with instruments or other apparatus where absolute polarization is required.

Show and Demonstration Room

With a view to more adequately displaying electric and gas appliances, for which they have a large sale, the Montreal Light, Heat, and Power Consolidated have opened an extensive show and demonstration room in the old Ogilvy Building, St. Catherine Street West, Montreal. The entire lower floor has been remodelled, the front windows also being utilized for showing various fixtures and appliances and for a model room. Prior to planning the space, similar departments of many of the largest companies in Canada and the United States were visited, and some of the ideas have been incorporated in the laying out of the new showroom. A feature is the appointment room, fitted up with easy chairs and generally made very comfortable.



To Manufacture Ferro-Silicon

A plant for the manufacture of ferro-silicon—a new industry—is being erected at Beaupre, P.Q. The building consists of one storey, and is to be built of brick and steel. The main furnace room will be 50 x 160 feet, and will contain three 3-phase, 3,000 kw. furnaces. There are to be nine 1,000 kv.a. transformers, which will be supplied by the Moloney Electric Company of Canada Ltd. A substation is to be built. The crusher room and storage sheds will cover an area of 70 x 200 feet. A large electric travelling crane will be installed in the main building.

Mr. E. A. Wallberg, of Montreal, who is largely interested in the Laurentian Power Company, of Seven Falls, several miles below Beaupre, is at the head of the project, and Mr. James Ruddick, also of Montreal, is manager of the new concern. The plant was designed by Mr. J. M. Robertson, consulting engineer, Montreal. The company has a large contract with the Imperial Munitions Board for the manufacture of ferro-silicon, and it is expected that the plant will be in operation within three months' time, with a daily output of 36 tons, and employing a staff of one hundred or more. The contract for the steel to be used in the building has been awarded to the Eastern Canada Steel Company. The electric power will be supplied by the Laurentian Power Company. Beaupre, the site of the plant, is a short distance below Quebec City, on the line of the Quebec Railway, Light, Heat, and Power Company.

Laco-dalite to Fit All Standard Reflectors

The Canadian Laco-Philips Company is putting on the market a glass product under the trade name of "Laco-dalite." "Laco-dalite" is simply glass chemically treated and made to fit standard sizes and shapes of all reflectors on the market. It is equipped with holders permitting it to be easily attached

to such reflectors. The manufacturer believe the glass will be largely used for display purposes in department stores and for industrial lighting where color values or accurate measurements will be required.

Canadian Drill and Chuck Company

Mr Harley W. Morden has been appointed manager of the Canadian Drill and Chuck Company, and is now in complete charge of this company. They have added several new departments, and have a fine line of service boxes and motor starters. There will be a big improvement in the service, and all of the lines will be guaranteed.

Manufacturers' Catalogues

Numerous trade catalogues issued by the larger American and Canadian industrial firms are so elaborate in pictorial and descriptive detail as to partake almost of a text-book character. In many technical schools these have been found to be almost a necessary adjunct to the class text-book, in fact. The Information Department, Vocational Office for Ontario, Invalided Soldiers' Commission, 185 Spadina Avenue, Toronto, desires to obtain at once literature of this character for placement where it will do most good, and this journal is glad to pass the pointer along.

To Conserve N. S. Water Powers

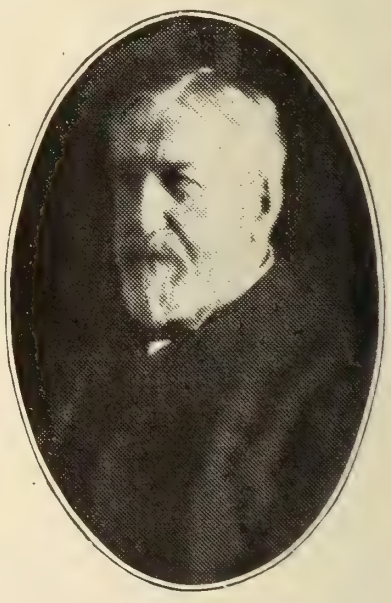
Following recent conferences between Mr. J. B. Challies, superintendent of the Dominion Water Power Branch and the Nova Scotia Water Power Commission, there was introduced in the Legislature of Nova Scotia recently a comprehensive water power bill declaring the ownership of the crown, in the right of the province, of all water and water power in Nova Scotia, and providing for administrative regulations to be approved by the governor-in-council. The legislation as introduced is considered to be comprehensive and timely, and should greatly assist in the conservation and use of the many favorably located undeveloped water powers in Nova Scotia.

New Books

Telegraph Practice—by John Lee, M.A., late deputy chief inspector of telegraph and telephone traffic, London; Longmans, Green & Co., London, publishers; price $1. This book is an attempt to outline the fundamentals of telegraph practice in such a way as to indicate differences in methods as adopted by different administrations. The chapter headings are as follows: The Acceptance of Telegrams from the Public; the Centralizing of Telegraph Traffic; Telegraph Instrument Rooms; Telegraph Instruments; the Telegraph Organism; the Delivery of Telegrams; Press Telegrams; Telegraph Tariffs; the Future of Telegraph Practice. 100 pages; size, 5 x 7 inches.

Theory and Operation of Direct-Current Machinery—by Cyril M. Jansky, B.S., B.A., associate professor of electrical engineering, University of Wisconsin; McGraw-Hill Book Company, Inc., New York, publishers; price $2.50. This work is prepared to meet the needs of students with a limited mathematical training. Only the more elementary principles and methods are used, sufficient to explain the quantitative relations of the physical quantities involved in the theory of a. c. machines. The following chapter headings indicate the scope of the work: Fundamental Magnetic Principles; Electromagnetism; Electromagnetic Induction; Units of Measurement; Transformation of Energy; The Continuous-Current Generator and Motor; The Magnetic Circuit of the Direct-Current Dynamo; Armatures; Uses of Electrical Energy; Types of Dynamos; Commutation; Operating Characteristics of Generators; Operation and Care of Generators; Operating Characteristics of Motors; Operation of Three-wire Systems; Selection and Installation of Dynamos. Well illustrated; 277 pages; green cloth; size 6 x 9 inches.

Personals



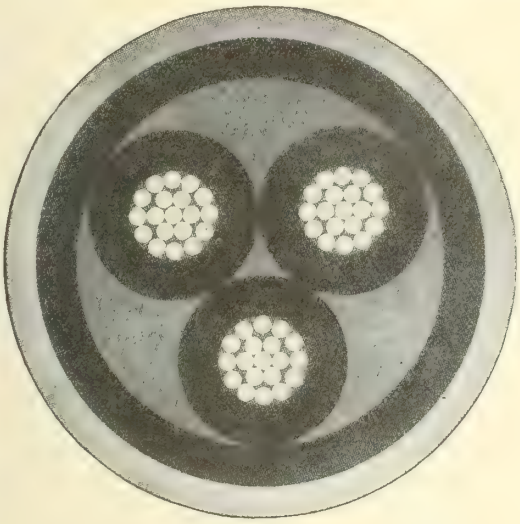
Mr. R. J. Swain, for the last 12 years electrician for the City of St. Boniface, Man., has been elected an associate member of the Canadian Society of Civil Engineers.

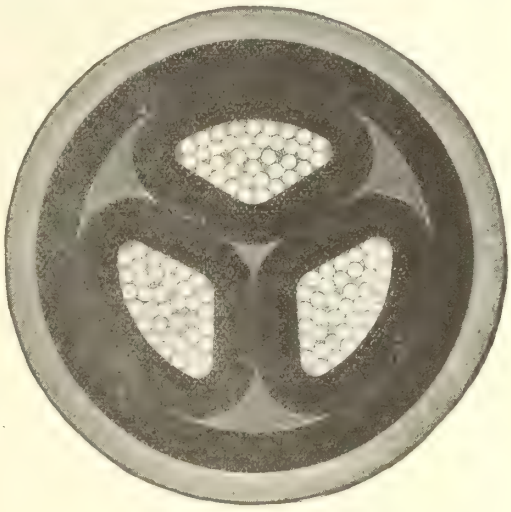
Mr. Arthur Gaboury, superintendent of the Montreal Tramways, has been the recipient from the French Government of the Blue Ribbon of Officer of the Academie. It is bestowed as recognition of his activities in the interests of French workmen in Montreal.

Obituary

Mr. Charles Fleetford Sise, chairman of the Bell Telephone Company and of the Northern Electric Company, Ltd., and a pioneer in Canadian electrical industries, died in Montreal on April 9, after three days' illness. He was 84 years of age. The cause of death was pneumonia, resulting from a severe chill contracted during an automobile ride. Mr. Sise was born in Portsmouth, N.H., was originally a captain in the mercantile marine, and later was engaged in the fire insurance business. In 1879 he came to Canada from Boston and organized the Bell Telephone Company, this being an amalgamation of various independent concerns. Mr. Sise was appointed managing director, and in 1890 became president, a position he held until 1915, when he resigned on account of advancing years, and was appointed chairman of the board of directors.

Under Mr. Sise's direction the Northern Electric and Manufacturing Company was formed in 1895, and four years later the Wire and Cable Company was organized, both these concerns manufacturing equipment for the Bell Company and also for private customers. In 1913 the two companies named were amalgamated, under the title of the Northern Electric Company, Ltd.





The Late Mr. C. F. Sise

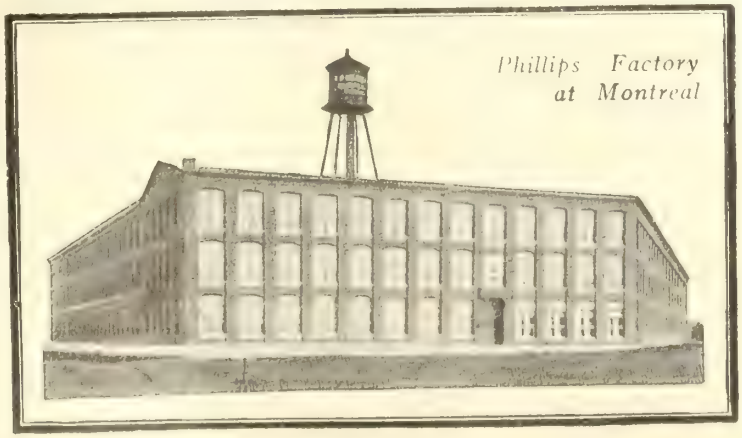
Canada undoubtedly owes a great deal to Mr. Sise for his untiring endeavors to develop the telephone and also for establishing large electrical industries, giving employment to thousands of people. The important position Canada holds to-day in the telephone field is largely due to Mr. Sise's efforts. He is survived by Mrs. Sise and also leaves two daughters and three sons—Mr. C. F. Sise, Jr., general manager of the Bell Telephone Company; Mr. E. F. Sise, president of the Northern Electric Company, and Capt. Paul F. Sise, general manager and vice-president of the Northern Electric Company, who is at present in New York with the British Recruiting Mission.

PHILLIPS' CABLES

as supplied to the Toronto Hydro Electric System

These illustrations show cross sections in the original size of cables recently supplied to the T. H. E. System and reordered by them for further extensions. The specifications are as follows.—Conductors composed of 37 strands each, .082 in. diameter. Thickness of dielectric on each conductor, .210 in. Thickness in belt, .210 in. Thickness of lead sheath, .160 in. Overall diameter, 2.61 in., 250,000 C.M. Three Conductor, Paper Insulated, and plain Lead Covered Cable for 13,200 volts. We can supply you with wires and cables of any size for Power, Lighting, Telephone, Telegraph, etc.

Write us for detailed information.



NOTE.—Specification of cable in left-hand cut: 3/0 B. and S. Three conductor. Each conductor 19 strands, each .094 in. diam. Thickness of dielectric on each conductor, .21 in. Thickness of dielectric on belt, .21 in.. Thickness of lead sheath, .15 in. Overall diameter, 2.60.

Specification of cable in right-hand cut: As stated in copy.

Current News and Notes

Edmonton, Alta.

Letters patent have been issued to the Unilectric Company of Canada, Ltd.; head office, Edmonton, Alta.; capital stock, $20,000. Chester McMann is at the head of the company, which is empowered to carry on the business of electrical and mechanical engineers, electricians, contractors, and manufacturers and to deal in electrical goods, both wholesale and retail.

Guelph, Ont.

The annual report of the Guelph light and heat department shows a total revenue of $100,288 in the electrical department, with operating expenses of $85,382 and net surplus of $9,266 after providing for depreciation and interest.

Grand'Mere, P.Q.

The Laurentide Power Company have under consideration the installation at Grand'Mere, P.Q., of three additional units of 20,000 h.p. each, making the total capacity 180,000 h.p.

Kingston, Ont.

The Kingston Utilities Commission have adopted power rates of 2.4, 1.7 and .15 cents instead of the old rates of 3, 2 and 1 cent per kw. hour.

London, Ont.

Instructions from the Militia Department to give flour mills first consideration recently rendered it necessary for the London, Ont., hydro department to turn over 300 h.p. to a new mill in that city. As a result it has been found necessary to arrange a schedule under which the various factories of the city will close one hour each day. The city is divided into eight areas, and one area will be without power each hour of the working day.

Montreal.

According to the statement by Mr. J. E. Aldred, the president, the Laurentide Power Company will probably increase the capacity of the plant to 180,000 h.p., for which it was designed.

Sir Lomer Gouin has announced the personnel of the Montreal Tramways Commission as follows: President, Judge St. Cyr, of the Court of Sessions, Montreal; engineer, Louis A. Herdt, professor of Electrical Engineering at McGill University; architect, John S. Archibald, Montreal.

Eugene F. Phillips Electrical Works, Ltd., Montreal, have received an order from the Postmaster-General's Department of the Australian Commonwealth for about a million feet of paper insulated lead covered telephone cable. This is believed to be the first order from this source which has been placed in Canada. The company have also received an order for paper insulated lead covered double steel tape armoured telephone cable from the Union Government of South Africa.

Mr. R. A. Ross, consulting engineer, Montreal, has been appointed by the Quebec Government one of the commissioners of the city of Montreal. He is one of five who have charge of the civic government. The appointment came as a surprise to Mr. Ross, who was named without being consulted. He is a past vice-president of the Canadian Society of Civil Engineers and a member of the American Institute of Electrical Engineers. Mr. Ross, who was formerly a member of the firm of Ross & Holgate, is well known in the electrical field, particularly in connection with the Ontario Hydro-Electric Commission, and the development and distribution of power at Niagara Falls. Lately he has taken a great interest in the work of the Honorary Advisory Council for Scientific and Industrial Research, especially in relation to the utilization, commercially, of the large bodies of lignite in the West.

Quebec.

Another storage dam is to be erected by the Quebec Streams Commission, of which Mr. O. O. Lefebvre is chief engineer. This dam will be at Lake Brule, ten miles from Beaupre, P.Q., and sixteen miles northeast of the hydro-electric plant of the Laurentian Power Company, on the St. Anne River. The dam will give additional water power to this company. The scheme consists of a stone-filled wooden dam, 225 feet long at the crest, and two small earth dams. The pressure face of the wooden dam will be at an incline of 45 degrees. The dam will rest on solid rock.

Regina, Sask.

Superintendent Bull of the Regina electric department reports a good sale of electric ranges. At the time of the annual exhibition last summer the department inaugurated a special campaign, and since that date about 70 ranges have been installed in residences.

Sydney, N.S.

The Dominion Coal Company Sydney, N.S., contemplate several extensions and improvements to their electrical equipment during the summer months. A central station is to be erected at New Waterford, and from this point transmission lines will be run to the locations requiring current. It is expected that electricity will also replace steam for haulage purposes.

Vancouver.

The Western Power Company of Canada, which on February 1st last took over the property of the Western Canada Power Company, reports an improvement for 1917. The revenue increased from $259,250 to $331,793, a gain of $27.98 per cent. During the year the expenditure was $58,628 on completion of power plant building, installation of equipment, extension to transmission and distribution systems, etc.

Trade Publications

C. G. E. Publications—Bulletin No. 43410, "Light for the Clothing Industry," and Bulletin No. 45103 A, "G. E. Type H. Transformers"; both well illustrated.

Condulet Suggestion—No. 20, by the Crouse-Hinds Company of Canada, describing more particularly the use of condulet bodies and outlet covers in the installation of panel boards. An actual illustration is portrayed showing the wonderfully neat and workmanlike job that can be turned out with the proper use of condulets.

Safety Switches—Safety auto-lock switches are described and illustrated in some detail in special publication No. 1585-A, just issued by the Krantz Mfg. Company, Inc., of Brooklyn, N.Y. These switches are designed for use on circuits wherever the ordinary knife switch may be applied. They are especially designed for safety, it being absolutely impossible to touch the live parts regardless of the position of the switch or of the door. They are particularly adapted for use in steel mills, factories, mines and other similar locations where men are employed who have no practical knowledge of electricity.

Accident Prevention Hints

Line construction and repair work are done by linemen reporting to headquarters. These linemen, working on street lighting circuits or other circuits which must be interrupted for them, should be adequately protected against the possibility of the switch being inadvertently closed. Because of the fact that there is no regular operator in attendance this problem is difficult, but the following solution is suggested, after a trial of a number of years in several sub-stations:

A leather envelope is used as a tag to be hung on the switch controlling the circuit to be protected. On one side of this envelope is printed the customary warning that men are working on the circuit. Within the envelope is a card properly arranged to receive full information as to the time the tag is placed and removed from the circuit, for whom it is so placed and for what purpose. The workman wishing to be protected makes his record on the card and hangs and removes the tag himself. Two or more gangs working on the circuit at the same time have equal protection, the last one to clear from the circuit removing the tag.

Lightning Arresters

Aluminum-cell lightning arresters have been very generally used for a number of years for the protection of distribution and transmission lines. They have been found to be highly efficient and require little attention, while it has been the prevailing opinion that their use introduces a negligible hazard. A recent fatal accident involving one of these arresters is worthy of attention.

It was found upon investigation that the charging mechanism was so arranged as to make it possible to leave it in the charging position, the charging contacts being found closed when the investigation was made. Evidently the man who had charged it ten hours earlier had left it on charge. The temperature of the oil had slowly risen until the film had disintegrated, allowing a rush of current and an arc, which exploded the oil in one of the tanks and tripped out the circuit. The operator at the source end of the line restored the circuit after a lapse of one minute, which was customary. About four minutes from this time the second tank exploded, with the result mentioned. The lessons to be learned from this incident are:

(a) Aluminum cell arresters under certain conditions become a grave accident hazard.

(b) Charging mechanism should be so arranged as to make it impossible to leave the arrester on charge.

(c) Frequent checks should be made to determine the amount of current passing through the arrester when charging. —N.E.L.A. Bulletin.

1—50 H.P. new General Electric, 440 volt, 1200 speed, 3 phase, 60 cycle, slip ring motor.

1—50 H.P. General Electric, 220 volt, 900 speed, type I, form L.

2—50 H.P. new Allis-Chalmers, 550 volt, 3 phase, 60 cycle, 900 speed motors.

MOTOR GENERATOR SET

1—40 KW., 125 volt, General Electric, 720 speed, type CL, form B, 6 pole generator, connected on one sub base to a 60 H.P., 3 phase, 60 cycle, 2080 volt, 720 speed, type M, form C, Fort Wayne motor in A1 condition and complete. Three bearing machine.

DIRECT CURRENT

2 100 H.P., 110 volt, Holtzer-Cabot D.C. motors, 550 r.p.m., full commutators.

1—10 KW., 125 volt, Bullock, 400 speed, marine set, direct connected on one sub base to a Westinghouse vertical engine.

1—50 KW., 125 volt, General Electric, 280 speed, type MP generator, direct connected to an 11 x 12 vertical marine type engine.

1—300 KW., 500 volt, D.C. General Electric generator, 400 r.p.m.

1—56¼ KW., 125 volt Westinghouse, 800 speed, type M generator, complete and in A1 condition.

1—80 KW., 125 volt, Crocker-Wheeler, 750 speed, type CCD generator.

1—90 KW., 110 volt, General Electric, 690 speed, type CL, 6 pole, form B generator.

1—300 KW., 550 volt, General Electric, 400 speed, type MP generator, D.C.

BOILERS

3—300 H.P. Holyoke Manning Boilers, now located in Massachusetts; good for 150 lbs; 11 years old, in splendid condition.

5—150 H.P. Manning Boilers, now located in New Hampshire; good for 135-140 lbs. Immediate delivery.

6—90" x 18' 6" horizontal return tubular Dillon Boilers, now located in Rhode Island, installed in 1905, for delivery in 2 months

Reaching Your Customers

THE logical place and time to talk to your customers is in the Electrical News when they are thinking of things electrical.

If your product is bought by electrical men, advertising in the Electrical. News will carry your message to them.

You and your wares may be favorably and nationally known to-day but if you don't advertise you will soon be forgotten.

Electrical News

347 Adelaide Street West

Toronto

Give it the Hammer Test!

The Non-Destructible Insulator

Spaulding HARD FIBRE

The Hammer Test will prove Spaulding Hard Fibre to be the superior insulator for every purpose. It won't break like porcelain, hard rubber and other insulators.

The only practical insulator for parts forced in or where excessive vibration or rough usage is apt to prove destructive.

The electric rupture of Spaulding Hard Fibre is 200 to 500 volts per .001 in. (1/1000) of thickness, and its tensile strength 10,000 to 20,000 lbs. per square inch.

Made in sheets, tubes, rods, washers and special shapes; red, black and grey colors.

BRADSTREET'S
Offices Throughout the Civilized World.
Executive Office:
Nos. 346 and 348 Broadway, New York City, U. S. A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished and are available only by reputable wholesale jobbing and manufacturing concerns, and by responsible and worthy financial, fiduciary and business corporations Specific terms may be obtained by addressing the company at any of its offices. Correspondence invited.

THE BRADSTREET COMPANY
Offices in Canada: Halifax, N.S.; Hamilton, Ont.; London, Ont.; Montreal, Que.; Ottawa, Ont.; Quebec, Que.; St. John, N.B.; Toronto, Ont.; Vancouver, B.C.; Victoria, B.C.; Winnipeg, Man.; Calgary, Alta.; Edmonton, Alta.

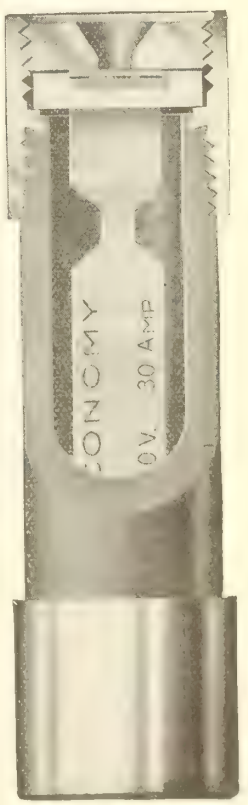
CANADIAN PORCELAIN CO.

LIMITED



HAMILTON - CANADA

Manufacturers of High and Low Tension Porcelain Insulators

ECONOMY

RENEWABLE

FUSES

protect millions of circuits and billions of dollars worth of property in thousands of plants representing every branch of industry.

They are used by the U. S. Navy, leading powder and munitions plants, ship yards, steel mills and others who put accuracy and safety before anything else.

They cut annual fuse maintenance costs 80 per cent., because an inexpensive little "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

No special tools or experience needed to replace the link and renew the fuse. Anyone can do it in a jiffy.

Order from your Jobber. Ask for Catalog 20.

The Chief Benefit

derived from

"No Spark"

CARBON BRUSHES

IS FREEDOM FROM TROUBLE REPLACING AND RESETTING BRUSHES. Being self-lubricating, they make the contacts practically frictionless and reduce commutator repairs enough to pay for themselves several times over. With these carbon brushes, the machine runs noiselessly without any sparking. These are facts which you can at once prove.

Stamped Fixture Pans

No. 218—10 in. and 12 in.

For the

Dealer and Jobber

Have you seen this new Stamped Pan? Secure one to-day and compare it with the ordinary spun pan. Note the fine, sharp lines and smoothness of metal, found only in our product, which is always found wanting in the case of the spun pan.

Our Finishes are Brushed Brass, Flemish Old Brass, Rich Gold and Matt.

DELIVERIES ARE GOOD. PRICES BETTER.

Saved by Oxy-Acetylene Welding

These two pumps were cracked in about 20 places by frost. A few years ago they would have been condemned as useless, but the most efficient, economical, and practical method is to weld them, which was done in this instance, and they are now giving as good service as ever.

There are many similar uses to which the Oxy-Acetylene Process may be profitably employed in your Industry, and our years of experience as Manufacturers of Apparatus of the highest efficiency and the necessary gases enables us to give you unequalled service in all matters pertaining to the Process.

Your enquiries are solicited, and will receive immediate attention.

LINCOLN MOTORS

Simplicity

Lincoln Arc Welder

The Lincoln Arc Welder is a simple machine which any one can understand and operate.

The motor is a standard Lincoln Machine, designed to operate on the kind of electric current you use.

It is direct connected to a generator which delivers electric current at the proper voltage for welding.

The control panel mounts the two necessary meters, a small hand wheel for regulating current and the simple knife switch connections.

The stabilizer is an electric magnet which gives stability to the current and makes the arc easier to control.

Insist on simplicity when you buy a welder.

Overhead Construction in Mt. Royal Tunnel, Canadian Northern Terminal Electrification, Montreal, Can.
W. C. Lancaster, Elec. Engr.

Special Standard Bronze
(S. S. B.)
High Strength Trolley Wire

was used in this electrification because, after rigid tests by unbiased engineers and careful comparison of results with similar tests on hard-drawn copper and steel, the superior strength, rust- and wear-resistance of S. S. B. Wire were found to meet every requirement of a service characterized by great extremes of temperature and hard usage.

The clearance in this tunnel is only 16 feet and the messenger cable had to be kept under great tension so as to flatten the catenary and reduce the sag to a minimum. S. S. B. Wire was, therefore, used here for both trolley and messenger.

S. S. B. Wire can be supplied in 40 and 60% conductivities as compared with copper.

This SOLENOID SWITCH has been adopted by the Hydro Electric Commission

They use it for

STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

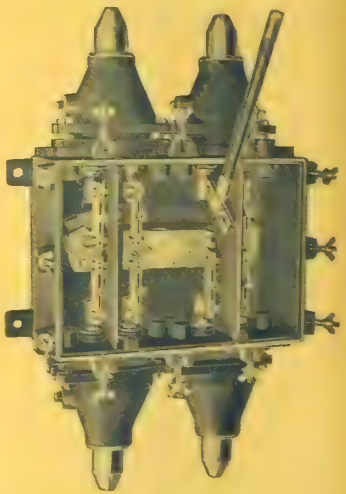
G&W ELECTRIC SPECIALTIES

The Essential Details of G & W DISTRIBUTION BOXES

are very carefully perfected

In the primary box illustrated, switch blade action is combined with bolted contact efficiency



Unit cable potheads with ample compound space make an easy installation without sacrifice of safe, permanent cable end insulation.

The entire box is lined with insulating material—all bolt heads, etc., are covered and different polarities are thoroughly barriered.

In the secondary box double U clips give better contact alignment than would a single U clip.

The unit cable potheads attach at an angle, gaining roominess without using excessive wall space.

The line of this material is complete, offering constructions suitable for all conditions.

Primary Box for 2300 Volt Use

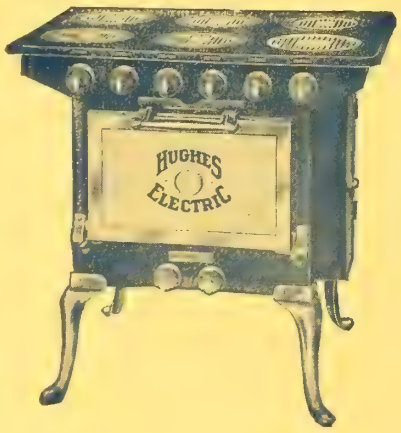
HUGHES
Electric Ranges



No. 50

HUGHES "50" ELECTRIC RANGE

This is one of the most popular styles of ranges on the market. Ideal for homes, suitable for medium or large size family, also for Clubs, Church Kitchens, etc.

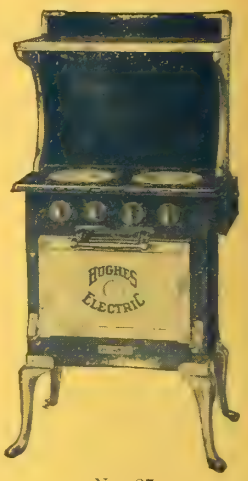
Features, 4-burner cooking surface, 2-burner oven, warming compartment, outside warming shelf, lower outside shelf. Finish either plain or nickled with white enamel splashers.

No. 48

HUGHES "48" ELECTRIC RANGE

Extremely handy; designed for large families, boarding houses, restaurants, hotels, clubs, etc., where a greater cooking capacity is required in a small space.

Features, 6-burner cooking surface, 2-burner oven. Finish either plain or nickle plated.



No. 44

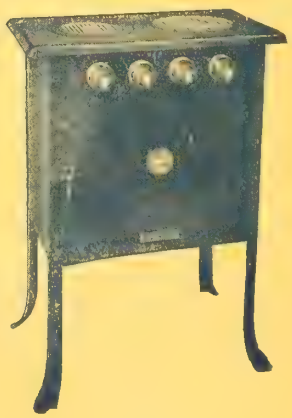
HUGHES "44" ELECTRIC RANGE

A very popular range because it uses little floor space and has elevated oven, exclusively for families of average size.

Features: 4-burner cooking surface, 2-burner oven, lower outside shelf. Finish either plain or nickle plated.

No. 27

HUGHES "27" ELECTRIC RANGE



The most desirable Range for small or medium size families with limited kitchen space.

Features, 2-burner cooking surface, 2-burner oven, elevated outside warming shelf. Finish either plain or nickle plated.

Electricity Makes Cooking Scientific and Economical

SCIENTIFIC—because they have introduced and adopted, virtually, every fundamental improvement in the development of the modern electric range—the most complete line of electric cooking apparatus in the world.

ECONOMICAL—because of economy of current, of food, of time and trouble. The HUGHES ovens are so constructed as to make it possible to turn off the current long before the food is cooked; because it does not shrink or dry out the food it cooks, hence an appreciable saving in market bills.

No. C-18

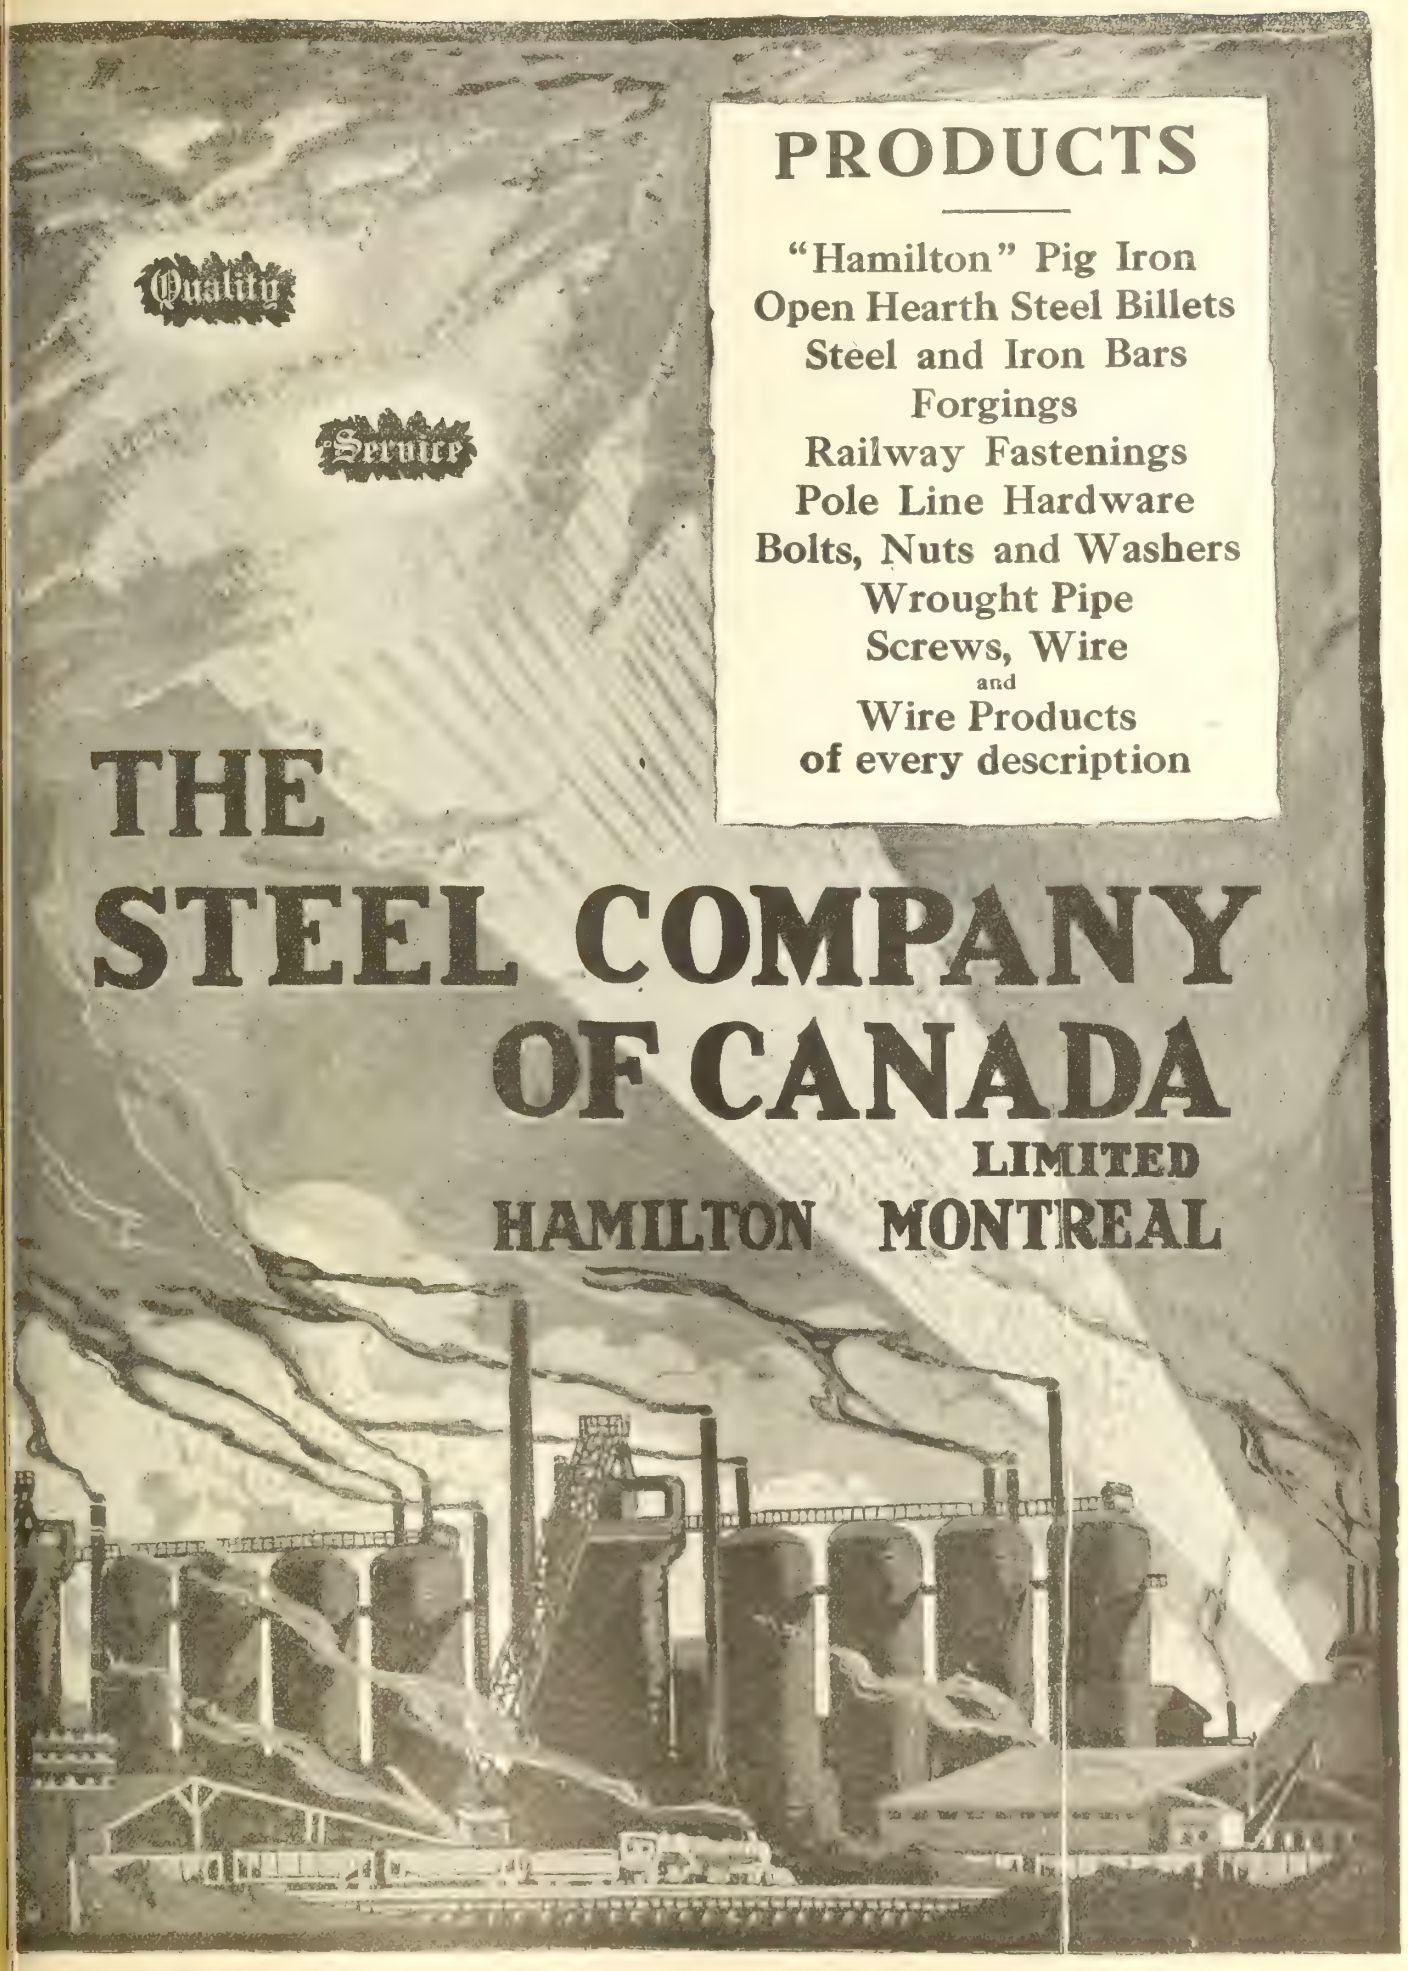
HUGHES RANGES are sold with a year's guarantee against defects electrical and mechanical, backed by the reputation of their makers. They are without doubt the best and most economical electric ranges on the market.

Awarded GOLD MEDAL, Panama Pacific International Exposition, 1915.

Tested and approved by the Underwriters' Laboratories of the National Board of Fire Underwriters—and also by Good Housekeeping Institute.

Write our House nearest you for further information as to literature, prices, etc.

HUGHES "C-18" ELECTRIC RANGE



It is solidly constructed of steel and cast iron, occupying floor space of only 17 x 25 inches, compact, neat, most suitable for light cooking. Finish plain black enamel.

Built On The Right Lines

By Canadian Workmen

This C. & H. Poly-Phase Meter

For instance, inside you will find that the room for making connections is much greater than is found in most meters.

Another outstanding safety feature is the use of Double Terminal Blocks, removing the danger of accident when the wires are subjected to heavy overloads and surge conditions during lightning storms.

This "safety first" principle has brought the C. & H. Polyphase into almost universal use.

Note: The wires are connected directly through the meter from left to right.

First, last and all the time this Polyphase Meter is dependable. We are building meters of quality, not price cutters.

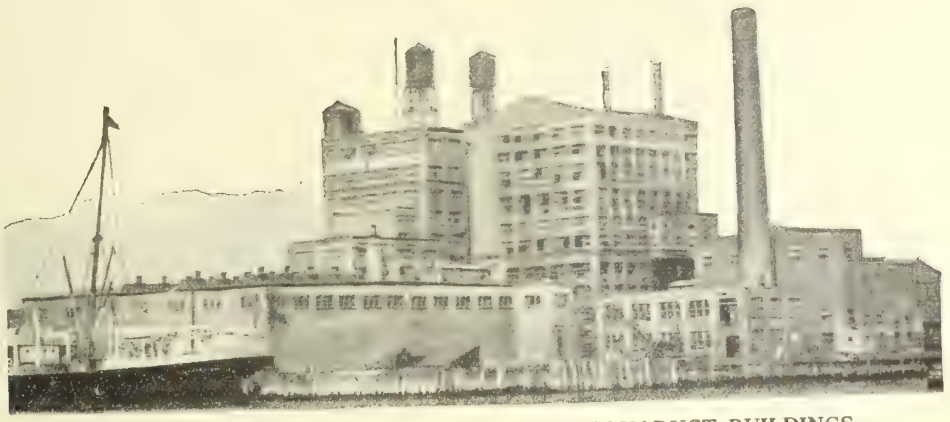
THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance. Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is $66.25 net, f.o.b. Philadelphia, boxed for shipment.



Bulletin No. 530 describes this instrument.

O-B PRODUCTS

Solving Overhead Problems

Whatever the problem, from the "spotting" of a frog to the building of a complete line, O-B Engineers are ready to assist you.

They are constantly in touch with line construction under a wide variety of conditions. They assemble and concentrate the experience gained through many years and focus it on the problem before them. Perhaps they have already found the way to remedy the things that are troubling you.

Whether or not you use O-B Line Materials the assistance of O-B Engineers is available to you.

Just write a letter and explain your problem.

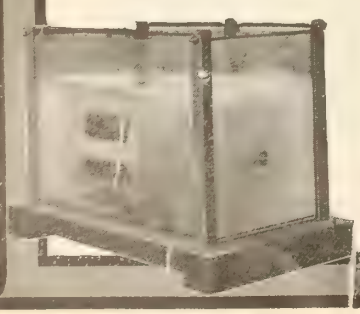
LINCOLN MOTORS

For Chemical Plants



The insulation on Lincoln Motors protects the windings against damage from acids, alkalies, and other chemical solutions.

In many large installations the motors are driving pulverizers, mixers and general machinery under the most severe conditions.

Lincoln Motors have been adopted in a number of Chemical Plants after long comparative service tests of several different motors.

New York Headquarters for the Canadian Electrical Trade

Here's the line you've been waiting for—made by men who have grown up with the industry.

"Now You've Hit It"—

That's a remark we frequently hear in introducing the "Premier" line of appliances. For the sterling goodness of "Premier" products needs no talk. The sturdiness, neat design, and superb finish are visible at a glance.

They are made by men who have served years in the business; men who know what you want; men who know how to build appliances with a merit that makes them easy to sell, worth the price paid, and a basis of customer-satisfaction.

And behind the "Premier" line is an organization known throughout the trade as progressive .Already strong advertising campaigns are under way. Folders and window displays of a new, striking character are ready.

All dealers who have seen "Premier" appliances are boosters. Distribution is coming fast—faster even than we anticipated. There's room for you in the "Premier" dealer organization if you get in quickly—before your territory is handed over to another live man.

DURABILITY

Type I-14 Watthour Meter

The Egyptians built for permanence. They put the best of their aptitude and facilities into every unit of their structure. Durability was their keynote and we admire them because their works show they lived up to it.

Where centuries ago they dedicated huge monoliths to the gods, the manufacturer of meters **today** dedicates his products to critical humans. Only by the satisfactory operation of these small mechanisms can his work be called a success.

The I-14 Meter is built by men long trained in that work and with facilities developed for that need. The materials used in their construction, too, are the best that can be obtained or manufactured. From back plate to cover the individual parts are built to last and give long service.

The extensive use of this one type of watthour meter by many firms, after submitting the meter to trying conditions, proves that our modern meter builders have imitated the ancients by retaining "Durability" as their watchword.

Robbins & Myers Fans

A NOISY machine is nearly always an inefficient machine, for noise usually indicates wasted power and wear and tear on the machine.

In the case of the Electric Fan, noise is especially objectionable, as a Fan is used in the home, office, theatre, and other places where noise is disagreeable and detracts a lot from the comfort derived from the fan.

Listen to any Robbins & Myers Fan in operation. You'll get a striking demonstration of one of the features which make R & M Fans so popular with users and such easy sellers for the dealer.

They are constructed so that the power is utilized to the maximum limit in circulating the air. Mighty little energy is wasted in useless churning of the air and production of noise.

Demonstrate this feature to your customers. It will make many R & M Fan sales for you

Toronto Section A.I.E.E. Has Spent Active Year

It is a matter of regret that there were no representatives of the manufacturers present to discuss the paper by Mr. Ackerman, of the Toronto Power Company, on "High Tension Insulators," which was read before the Toronto section, A.I.E.E., on Friday, April 19. The paper, which dealt with the operating aspect, was a most thorough one, and showed not only the improvements which the last decade has brought about in the line insulator, but also the opportunity for further development to produce an insulator which should prove more resistant to power arc discharges, as well as to punctures. The modern pin-type insulator shows a somewhat more compact design than that of ten years ago, being more free from deep and intricate cavities which were of little use in preventing leakage and none at all in reducing the risk of flash-over. Mr. Ackerman commented upon the desirability of drawing the arc away from the insulator, and pointed out that arcing horns and the well-known Nicholson ring were not thoroughly effective in this respect, as they rather tended to localize the flashover until it was ruptured, or until the insulator failed. A new type of arcing horn was described, which took the form of a spiral around the wire with a radius equal to the depth from the wire to the foot of the insulator pin. It was shown by a remarkable series of photographs that this would instantly draw the arc well away from the insulator towards the tip of the horn, and that until the short was cleared no damage could happen to the insulator.

In the discussion Mr. H. C. Don Carlos did not agree with the author in extending the field of pin type insulators into the region above 60,000 volts; rather would he expect to see suspension insulators adopted for 44,000 and all higher tensions. In conversation with the engineers of the Mississippi River Power Company, he had learned that practically all the failures on their 110,000-volt lines had been due to cracks in the porcelain, and he believed that this experience was not unusual. Mr. Davison pointed out that among other advantages the suspension insulator permitted of easier testing of the insulators on location, and, furthermore, that it lent itself to standardization. If manufacturers were to be asked for pin type insulators of 50,000, 60,000, 70,000 volts and higher pressures, the cost of insulators would naturally be higher and the deliveries less satisfactory than where suspension strings of standard elements were specified for these voltages. A number of other most interesting points were raised in the discussion, which tended to demonstrate that there is considerable diversity of personal opinion among transmission engineers regarding the insulator problem, and that the same problem is being effectively solved in more than one way in different installations.

The Toronto Section has just achieved a new record among the thirty-three sections of the American Institute of Electrical Engineers. Fifty-two new applications for membership have been filed during the campaign which ended on April 30 last; this corresponds to an increase of about 25 per cent. and, we understand, is ahead of that of any other section, and testifies to the appreciation in which membership in the institute is held. Non-members often do not realize that a distinct advantage is associated with membership in the Institute. The opportunity given for associating with members of the same profession in different grades is of inestimable value. Great credit is due to Mr. A. B. Cooper and his membership committee for the results obtained. We are advised that the actual number (as distinct from the percentage) of members signed up in Toronto was surpassed only by Philadelphia and Pittsburgh.

The result of the elections for officers of the section for the next year was declared at the meeting of Friday, April 19, as follows:

Chairman—Arthur H. Hull (Hydro-Electric Power Commission).

Secretary—Ernest V. Pannell (British Aluminium Company, Ltd.)

Executive—Ashton B. Cooper (Canadian General Electric Company, Ltd.), Frank R. Ewart (Ewart & Jacob), William G. Gordon (Malm, Gordon & Co.), W. Percy Dobson (Hydro-Electric Power Commission), William Volkmann (Toronto Power Company), Herbert B. Dwight (Can. Westinghouse Company, Ltd.), Gordon R. Langley (Can. General Electric Company, Ltd.) The last-mentioned two are out-of-town members.

First Convention of Municipal Electrical Association

The Association of Municipal Electrical Engineers, plans to hold its first meeting on June 14th and 15th next, at Niagara Falls, Ont. An interesting programme is being prepared, consisting of papers on subjects of importance to the delegates, and a tour of inspection of the Chippewa Creek development. Although this organization has been formed for the benefit of the officials of municipally owned electrical utilities in Ontario, yet it is felt that there will be much in the proceedings that will be of interest to men in the electrical trades who are doing business directly with those utilities. The Association, therefore extends an invitation to electrical manufacturers, contractors, and dealers to have representatives attend that meeting, and assures a hearty welcome to all coming in such capacity.

Montreal Electric Luncheon Club

"The Value of Air Brakes" was discussed by Mr. W. J. Hatch, of the C.P.R., at the Montreal electrical luncheon on April 24. Considering the investment, said Mr. Hatch, there was no part of the railway equipment that would give greater material returns when properly installed, maintained, and operated than the brake. Electric locomotives were no longer to be regarded as experiments, and there was reason for believing that a train would be accelerated up to a speed of 60 miles per hour in one minute. This meant that the brake was going to be more important in the future than in the past. The ability to accelerate, or even to run at high speeds, must be measured by the ability to stop.

This feature was little appreciated. As an example, railway men were often called upon at investigations to answer such a question as this: "In what distance should the train have stopped?" It seemed a simple question for an air-brake man to answer, but to do so it would be necessary to know the light weights and loads of the vehicles composing the train; the percentage of brake power used with engine and cars; if brake shoes were applied to all wheels, including engine truck and trailer wheels; type of brake; pressure carried; whether the train was accelerating or decelerating; on curve or straight track; on ascending or descending grades, or level; the condition of the rail; if brakes were applied in service or emergency or ordinary service then emergency; the piston travel on each vehicle; the losses due to friction of parts; brake beam release springs; wind resistance; quality and thickness of brake shoes; the method of hanging them, and other factors.

One heard very little about brakes in the papers, nothing like one did about electricity, for instance, yet it had been much more of a factor in railroad development up to the present time than electricity. A good brake must be automatic, simple, durable, always ready, responsive, and flexible, and, in addition, it was imperative that in a case of emergency the maximum brake power be obtained with the time element reduced to a minimum, so that a stop could be made in the shortest distance and time possible. For service or regular stops all these elements should be extended so that the trains could be handled smoothly and acurate stops made without inconvenience to passengers or damage to lading, keeping in mind at all times that in time of danger to stop was the chief consdieration. The braking power on hand must be available not only for one application but for any number of them. Not only must the brake dissipate energy due to momentum when bringing a train to a stop but it must prevent the accumulation of energy when descending a grade. A train of 3,000 tons commencing the descent of a 2 per cent. grade, at a speed of ten miles per hour, would in three minutes, due to acceleration of gravity alone, be moving at a speed of 64½ miles per hour, and the kintic, or wrecking energy, stored up in the train would be 417,500 foot-tons, sufficient to raise the train to a height of 139.1 feet. So it was necessary for the brakes to be able to dissipate in three minutes 417,500 foot-tons, if the speed at the end of this time was not to be higher than at the beginning, and still have a reserve to make any desired stop.

There was a prevailing idea that the friction between the brake shoes and the wheels was what stopped a moving train. No doubt this was the primary cause, but the real factor was the friction between the wheel and rail. For instance, if the rails were made of ice, it was obvious that the stop would be lengthened very much; the friction between the brake shoes and wheels would be sufficient to lock and slide the wheels. Therefore, brakes had to be designed in such a manner as to prevent wheel sliding; it was also obvious that the rail condition was a large factor in relation to the distance required to stop a train.

Unfortunately for air-brake men, co-efficient of friction (which was the relation between the retarding force and the pressure on the brake shoe) was one of the most elusive and variable things in mechanics, and increased with the decrease of speed and to a surprising extent. For example, a train running at 60 miles an hour would require approximately at least four times the distance to stop in than if the train were only running 40 miles an hour.

Mr. Hatch then dealt with the financial side of the subject, pointing out that the daily charge for the brake equipment per car was 1.095 cents, which was 44/100 of 1 per cent. of the daily revenue (2.50) which the brake made possible.

McGill Examination Results

The results of examinations in the faculties of Arts and Applied Science at McGill University have been made public. In Applied Science, Mr. Emil Edwin Weibel, who graduated as a mechanical engineer, won the British Association Medal, and the Crosby Steam Gauge and Valve Company's prize for summer essay, while he took honours in hydraulics and laboratory and hydraulic machines, machine design, and thermodynamics.

Passed for B.Sc. Degree

Civil Engineering—Henri B. Pelletier, Montreal. Unranked—Arthur A. Brown, Ottawa.

Electrical Engineering—In order of merit—Joseph M. Conroy, Britannia Bay, Ont.; Joseph A. Dionne, Montreal; William McL. Moore, Sydney, N.S.; William R. Way, Montreal; Daniel McL. Sutherland, New Glasgow, N.S.; Leo J. Jordan, Lindsay, Ont.; Thomas J. Fox, New York; Frederick L. Cann, Peterborough, Ont. Unranked—Ira W. Beverly, Rossland, B.C.; William H. Gorrie, Kenora, Ont.; James F. Patterson, Montreal; Roy A. Weagent, New York.

Mechanical Engineering—In order of merit—Emil E. Weibel, Montreal; Charles S. Parke, Hamilton; Hugh A. Crombie, Toronto.

Mining Engineering—In order of merit—Harold M. Roscoe, Centreville, N.S.; Edward A. Livingstone, Washington D.C. Unranked—William Weir, Notre Dame de Grace, P.Q.

Chemical Engineering—In order of merit—Herman R. Dorken, Westmount, P.Q.; Clifford Greaves, Barbados, B.W.I. Unranked—George G. Ulmer, Jr., Montreal.

Small Hydro Plant for College

A hydro-electric plant for the College de Montfort, P.Q., is to be rebuilt, the contract having been let to Messrs. Arsenault & Plamondon, Limited, Montreal. A concrete dam, 10 ft. x 12 ft., is to be constructed at the entrance to a small lake, a wood stave pipe line, 3 ft. in diameter, inside measurement, conveying the water to a power house, of brick and concrete, 25 ft. x 15 ft. The water wheel will be of 150 h.p., and will be manufactured by the William Hamilton Company, Limited, Peterborough, Ont. The power will be used for lighting the college, sawing wood, and for laundry purposes. The water is to be pumped for domestic use and for fire fighting purposes. Arthur Surveyer & Co., Montreal, are the consulting engineers, the electrical work—a portion of which is already done—being carried out by E. Lionais, Montreal.

The Kincaid Waterwheel and Power Company, Ltd., has been incorporated; head office, Vancouver, B.C.; capital stock, $50,000. The company is empowered to carry on a general electrical engineering and contracting business, including the manufacture and installation of waterwheels and all kinds of electrical power and lighting equipment.

Electric Heating—Some Practical Experience

Installed Capacity of 1.2 to 1.8 Watts per Cubic Foot of Air Space Gives Normal Living Temperature

By Mr. E. R. Shirley*

Electric heat is simply electricity displaying its energy in the form of heat. We might call it the modern scientific method of heating.

Some of the particular advantages which are hard to appreciate, except by using the same exclusively, are enumerated below:

1. Great efficiency, the electric heater being nearly 100 per cent. efficient.
2. Entire absence of smoke, dust, and fumes.
3. Elimination of storage and handling of fuel.
4. Lessening of fire hazard.
5. No vital oxygen is consumed from the air as in the case of open flame heaters.
6. Great flexibility in temperature control, it being readily adapted to automatic control schemes so that any predetermined temperature may be constantly maintained.
7. It is extremely portable, heaters being readily located wherever required within very wide limits.
8. Heat is instantly available at the turn of a switch, scarcely any care or attention being required, the heat ceasing immediately the switch is opened.

My first serious attempt at electric heating was in Northern Ontario, when with the British Canadian Power Company, at Cobalt. A number of the houses for our staffs and also our office and several other buildings were heated electrically. We made no particular attempts at making tests or taking records of the amount of power required, simply installing as much heat as we were sure would suffice and then using whatever percentage of that heat that we found was required. I might say that we averaged about three watts per cubic foot of heated air space installed capacity, but seldom used more than from 30 to 50 per cent. of this amount.

The heaters were individual units, made in our own machine shop, and consisted of ¾ in. spiral coils of resistance wire for some and galvanized iron wire for others, the wire being usually about 14 B. & S. gauge. These were strung on 1 in porcelain knobs, fastened to an iron framework, and the whole heater encased in perforated sheet metal.

While I was in this district we designed heaters for a number of the buildings at the Wettlaufer Mine, in South Lorraine, where the famous Keely Mine is located. These were detached buildings, previously heated by steam from the main steam plant. The boilers were fired by coal, which had to be brought up Lake Temiskaming by boat to Silver Centre, and from that point hauled about eight miles, over a rough road. The laid-down cost of the coal would be in the neighborhood of $12 per ton. We based our calculations on an efficiency of about 10 per cent. for the detached steam heating and 100 per cent. for the electric heaters, and found it worked out quite satisfactory. This was not cheap heating by any means, as the Wettlaufer people paid us a price for the power used which amounted to about 1 cent per kw. hr. They, however, were quite willing to pay the price for the convenience and safety involved.

Later on, when connected with the Canadian Exploration Company, I did considerable further experimenting with electric heating. We had been using steam heat and were distributing it among a number of detached buildings. Coal was costing from $12 to $15 per ton, laid down. We had a considerable available surplus of electric power at 550 v., which was costing us $16 per h.p. per year, or about ¼ cent per kw. hr. I designed a heater which took 7 amperes at 550 v., or 3.85 kw. This was found to be a very satisfactory size, so we used it exclusively. When a large heater was required we combined two in the form of a double circuit unit.

In mining communities nothing, as a rule, is installed which is required to last longer than the lfe of the mine, which, ordinarily, is but a few years. For this reason our heaters were made as cheap as possible. The frames were of 1 in. x 1/8 in. band iron. The coils were of ordinary stovepipe wire, wound in spirals on a 5/8 in. mandril. The spirals were strung on 1 in. porcelain knobs. The heaters completed cost about $3 each to make. The iron wire does not last as long as the better grades of resistance wire, but it is cheap and easily replaced when required.

In my own house, which was a one-storey frame bungalow, 32 ft. x 24 ft., with 10 ft. ceilings, which, allowing for the walls, had a cubical contents of 7,230 cubic feet, I had very good results. This was boarded and then covered with builders' paper and clapboards. Inside was finished with beaverboard, placed directly on the studding. The floors were of hardwood. There was no foundation, the house being simply placed on posts, the basement being boarded up with one layer of inch boards and covered with heavy tarred felt, fastened with 3 in. battens. The windows were standard construction on pulley weights and fitted with double windows for winter. The doors also were fitted with storm-doors. The absence of a foundation made it necessary to run a 2 kw. heater in the cellar to keep it above freezing temperature. I had about 13 kw. power installed, which was a total of 1.8 watts per cubic foot.

This total amount was never turned on more than two or three times during the time I occupied the house. The maximum in cold weather was usually 8.9 kw., or 1.23 watts per cubic foot. This amount, in addition to heating the house to 70 degrees F., did all my cooking. Outside temperatures at times went as low as 43 degrees below zero. At one period, in February, 1914, the minimum temperature for a continuous perod of three weeks ranged from 18 degrees below zero to 43 degrees below zero. During this severe weather I had no difficulty whatever in keeping my house temperature at 70 degrees F., and using only 1.23 watts per cubic foot as a maximum.

The average for this period did not run over 90 per cent. of this, approximately 1.1 watt per cubic foot, making the cost of heating the house and doing the cooking in the severe weather about 48c per day at the price we were paying for power, viz., ¼c per kw. h. At the present rate in Peterboro, of 1¼c per kw. hr., this would have cost $2.40 per day, or about $72 per month, less discount.

The other installations at this same plant ran about the same in capacity. One building had as low as 1.2 watts per cubic foot installed, and the occupants claimed it was comfortably heated.

At the Laurentian Power Company's plant, near Quebec City, I had an opportunity of making some very exact tests on a complete electric heating plant which we had installed in a six-house terrace for our staff. This terrace was of 46,688 cubic feet capacity, being a two and a half storey frame structure, placed on a solid concrete foundation. The walls were boarded with 1 in. boards and covered with builders'

*Read before the Peterboro Engineers' Club.

paper and clapboards. The interior was lath and plaster. The windows were standard construction, on pulley weights. The doors were also standard. There were double windows for winter, but we did not use them, as e found they were hardly necessary—in fact, there were usually one or more windows in each house opened probably a foot. There were no storm doors or porches. The basement was quite open at the top of the concrete foundation, due to poor consruction, so that the cellar temperatures were seldom more than a few degrees above freezing.

The temperatures were taken in the house situated at the north end, on a thermometer placed close to the north wall. Outside temperatures were standard government readings, taken especially for our plant. Power readings were taken both day and night, on a meter installed for that particular purpose.

Each house was arranged with ducts in the walls and registers in each room as for ordinary hot-air heating. The heating plant consisted of two iron boxes in the basement, near the centre of the terrace. These were lined with ½ in. asbestos, and contained the heating elements, which were advance resistance wire strung on porcelain knobs on iron frames. Each box contained 18 frames, so arranged that they could be connected to a 550 v. 3-phase service, with switches for connecting the set in closed or open delta, two sections in series across one phase or one set singly across one phase. This gave a large degree of heat variation. Each heater was 50 h.p. capacity, or a total of 100 h.p. for six houses. One end of these boxes was connected with a long duct, which in turn connected with the heating ducts of the various houses; at the other end of each box was a motor-driven fan, capable of delivering 2,000 cubic feet of free air per minute. These fans forced the air through the heaters and into the houses.

A continuous test run on the heaters from February 17 until March 31, 1917, gave an average internal temperature for the houses of 70.3 degrees F. The average minimum temperature of the outside air, to the end of February, was 8.67 degrees below zero, giving a heating range of approximately 79 degrees F. The average watts per cubic feet of heated air for this period was 1.27. During March the average minimum temperature outside was 10.3 deg. F. above zero, giving a heating range of 60 degrees F., the average watts per cubic feet of heated area being .93. The maximum amount of power used at any one period was 1.63 watts per cubic feet of heated area at a time when the minimum outside temperature was 28 degrees below zero and the maximum outside temperature just zero. The internal temperature during this period was just 70 degrees F., giving a heating range of 98 degrees F.

In considering these figures it should be remembered that the results obtained both in Northern Ontario and Quebec were in places where the climate is exceedingly severe.

Our results at the plant of the Laurentian Power Company and also in Northern Ontario were so good that we found it difficult to get them generally accepted. This point of view is readily understood when we consider the fact that the formulae generally used for computing the necessary heating will, in nearly every case, give the amount of power required at probably double the quantities I have found to be actually necessary. The formulae I refer to embrace a large number of constants, which vary according to the type of house or building to be heated, the amount of exposed wall surface, the number and character of windows and doors, the number of changes of air per hour, and the nature of the heating, i.e., whether it is constant or more or less intermittent. In considering all these facts, it is easy to vary the formulae constants within such limits as to entirely alter the heating problem. For this reason when using a formulae for making any such calculations the problem in hand must be very carefully studied.

In view of the results I have obtained in different parts of the country, and under very severe conditions, I have no hesitation in saying that equally good results can be obtained in Peterboro by using a maximum installation not exceeding 1.25 watts per cubic foot of heated air space. The average power required would probably not run more than one watt per cubic foot, even in the severest weather. I make this assertion from the fact that the houses in a city are, as a rule, better constructed than in the outlying districts where I conducted my experiments. Furthermore, the climatic conditions are not nearly so severe, neither are you exposed to the elements so directly in a closely-built up community.

An average house in Peterboro would probably be around 8,000 cubic feet in capacity of air to be heated. Supposing it is desirable to heat it to 70 degrees F. throughout, about 10 kw. would probably be sufficient to take care of the average conditions. At the present rates of 1¼c per kw. hour this would cost 12½c per hour, or $3 per day, less the discount. As it is hardly desirable, in most cases, to heat the entire house to 70 degrees, this figure might be reduced to 60 per cent., or say $1.80 per day, less the discount. It now seems possible that the Hydro rates may be cut to 5/8c per kw. hour where the power consumption runs up to 60 kw. hours or over. This would reduce our figures to 90c per day. Taking off the 10 per cent. cash discount makes this 80c per day. For an average 30-day month this would amount to about $24; or, supposing you heat for approximately six months in each year, it would be roughly $144 per year, which figure would be not unreasonable, and would be equivalent to from 12 to 14 tons of coal at the present price.

Individual heaters would probably be the cheapest installation. A circuit can be run in the basement and brought up through the floors wherever it is found most expedient to install heaters. One or two circuits would take care of the upstairs heating. In fact, small heaters up to 600 watts capacity may be used on the ordinary lighting circuits where the wiring is strictly up to date.

Individual heaters can be purchased from most any electrical dealer, in sizes ranging up to 5,000 watts capacity, and at prices up to $35 and $40 each. For instance, a 1,200-watt heater sells at about $16, and a 2,400-watt size at about $22. A 1,200-watt heater would cost to run at present rates 1½c per hour, less discount, and the 2,400-watt size 3c per hour, less discount. It is now possible to obtain very nice electric logs in capacities up to 3,000 watts and at prices up to $28. A 3,000-watt log would cost to run at present prices 3¾c per hour, less the discount, which is much cheaper than the equivalent gas log.

Another form of heating which I might touch on here is the electric circulation water heater for a range boiler, and which could be easily attached to a hot water system. I have used a large number of these and find they give excellent service and are very economical. The ordinary heater can now be obtained in capacities of 600, 1,000, 2,000, and 3,000 watts each. The 600-watt heater is for continuous operation on a 30-gallon tank and the larger heaters for intermittent operation. The 3,000 watt heater heats 25 gallons of water from 50 degrees to 140 degrees F. in one hour, and is practically equivalent to the ordinary gas heater consuming 50 feet per hour. In this case the gas heater would cost 7c for an hour's run, at the present rate of $1.40 per thousand cubic feet, while the electric heater would cost 3¾c, less the discount, or practically half the price of the gas. Two or more high capacity circulation water heaters attached to a hot water system should be sufficient to heat a house. The circulation heater has been developed even further in the induction type, which may be obtained up to 100 kw. capacity, and have even now been used in certain installations for developing steam in a steam boiler.

The next problem that presents itself is, Can we obtain the necessary power? Peterboro has a population of about

23,000; assuming four or five persons to a house, there would be approximately 5,000 houses. Providing 20 per cent. of the houses would desire electric heating and that an average of 8 kw. per house was installed, which would be a fair estimate, we would require 8,000 kw., or over 10,000 h.p. A fact to be considered here, also, is that the greater part of this power would be used during the winter months only, and some other use would have to be found for it in the summer, in order to make the installation profitable. Of course, we might ease the fuel situation considerably by utilizing any available off-peak load during part of the 24 hours and using coal or wood during the time the peak load is on. This would need careful investigation, and would have to be handled by the Hydro representatives.

Another point I have not touched upon is the increased capacity required of the secondary distribution system should such a heating load be taken on. This also would have to be referred to the above representatives.

Shawinigan Falls, Que., Wonderful Power and Industrial Centre

"Shawinigan Falls, its industries, electro-chemical activities and transmission of power," was the subject of a talk by Mr. H. E. Randall, of the Shawinigan Water & Power Company, at the Montreal Electrical Luncheon, on March 13. The talk was illustrated by a large number of pictures, showing the expansion of Shawinigan Falls, from a place with practically no population, to a town of over 12,000 inhabitants; the large number of buildings devoted to new industries, many of them now engaged on war work; and also interior and exterior views of the power plants there and of the Laurentide Power Company at Grand'Mere.

The town of Shawinigan Falls, said Mr. Randall, was predestined to become important, due to the falls on the St. Maurice River, which are 150 feet high there, and due to the fact that this spot furnished what at that time was probably the cheapest hydro-electric development of the world. After much hardship and ups and downs over a period of ten years, the Shawinigan Water & Power Company finally got on to a strong financial basis and was delivering some 50,000 h.p., used for aluminum, paper, and transmitted for lighting and power to the various parts of the province. From that date the general use of power in the province increased tremendously. The power houses which produce power, which has made all these things possible, contain to-day an installed capacity of 196,000 h.p. The city is the result of the workmen and management drawn there to operate the large factories which have located there. The Northern Aluminum Company, the Belgo Canadian Pulp & Paper Company, the Canada Carbide Company, the Canadian Electro Products, the Canadian Electrode Company, the Canadian Electro Metals Company, Fraser, Brace & Company's steel plant, and the latest addition to the Shawinigan industries is the Canadian Aloxide Company (the Canadian name for the Carborundum Company), who will employ 24,000 h.p. in the works which are now started, nearly twice the amount of power used by the Carborundum Company at Niagara Falls. Some of the carbons for electric furnaces manufactured by the Canadian Electrode Company were 1½ x 7 x 8, and carried a current of 40,000 amp. La Loutre dam, a picture of which was shown, will nearly double the capacity of the Shawinigan Company, and will impound water representing a million kw.h.

The transmission system of the Shawinigan Company amounts to about 1,700 miles of line, reaching the more important places of the Province of Quebec. Practically all the asbestos of the world is mined with Shawinigan power; by far the larger portion of the paper made in the Province of Quebec is made with Shawinigan power; by far the larger portion of electric light used in the Province of Quebec is supplied by Shawinigan power—so that this transmitted power has come to have an important bearing on the life of the province. This has been particularly true since the war. In other times the munitions plants would have had to wait for the motive power to operate, whereas the power companies and electrical apparatus companies were ready and waiting to supply the motors and the power to turn these plants as quickly as they could be assembled. This speed and the resultant economy of operation have been important factors in this war. Moreover, electro-chemical processes at Shawinigan, some new, others old, have every one of them supplied important munitions demands and have been a great factor for that reason.

They heard a great deal about the Ontario hydro-electric system, but the Shawinigan Company had three power developments, any one of which would handle the entire load of the Ontario system in 1916. Continuing, Mr. Randall remarked: It is open to serious doubt whether the future commercial loads, as we know them, will be handled by Hydro-electric plants or by steam plants. The present efficiency of conversion from water to electricity is well up to 90 per cent.; the present efficiency of conversion from heat in coal to electric power is around 20 per cent. In the one case you have practically no possibilities; in the other case you have tremendous possibilities of betterment.

At the present time, for ordinary commercial city loads a well designed steam plant having large units, properly located with respect to water, etc., can supply in most parts of North America now settled, electric power for distribution in city streets at a price which favorably compares with Hydro-electric transmitted power. This is shown by the remarkable success of the 100,000 h.p. steam plant located at Buffalo. What then would result if somebody should produce —as no doubt somebody will produce—a metal capable of withstanding temperatures of a red heat at high pressure? Immediately the efficiency of conversion from heat to electricity would jump, and all our elaborate transmission systems would be open to obsolescense, due to changing methods, because they cannot be materially improved.

Different Forms of Power Transmission

With regard to transmission, electricians think only of electricity as a means of transmitting power, but what is a train of coal but a means of transmitting power—latent power, it is true, but it is transmission nevertheless. What is the conduction of oil through pipe lines but the transmission of power? And it is interesting to note that these two methods of transmission far outstrip the transmission of power by electricity in distance, there being pipe lines in the United States nearly 2,000 miles long. So then, since there are several kinds of transmission power, the electrically transmitted water power has to compete at the receiving end with the power transmitted by the railway line or otherwise, and in this country where steam is used for heating during a large portion of the year a still further advantage exists for other kinds of power derived from heat, but nevertheless, with cheap power at the source and with careful transmission, with low loss, which in good lines should not exceed 5 to 10 per cent., it is possible to economically compete with other transmitted power, and as a result the transmission lines grown up.

Transmission, however, has another aspect, and which will no doubt in the future become a most important aspect, that is, transmission lines will not be used so much for trans-

mission of hydraulic power to its centres of use, but rather for the tying together of all sources of power, so that the use of electricity, or of the powers of the country transmitted to your door by means of electricity, may be well nigh universal. A map showing the more important transmission lines of the United States and Canada indicates that these transmission lines have been built up almost exclusively around water powers, there being a few through Ohio, Pennsylvania and Illinois which are steam transmitting systems, but these three states show the new tendency, the linking together of large stations, feeding a vast network which brings about a uniformity and continuity of supply at a low price, so that the public utility is able to supply the public with that which it desires at the lowest possible cost, and is, therefore, successful.

I predict that the transmission lines will in the next ten or twenty years become pretty well inter-connected so that we will have not a large number of large or small separate systems, but a large inter-connected system, presumably made up of a few large organizations inter-changing their energy on some equitable basis.

We must not let our enthusiasm run away with our better judgment when it comes to hydro-electric power. To-day it is a fetish in some parts of Canada, but it is subject to many pitfalls, the most important one of which is other kinds of transmitted power, but it nevertheless has a big future, especially for those kinds of loads which we call high load factor loads, that is, those loads which will use the tremendously heavy investment in hydro-electric generating stations and transmission lines the greatest number of hours in a year. For other loads, that is, low load factor loads, other means of producing power will probably show up more advantageously than the present harnessing of hydraulic power.

Electric Heating

We are hearing to-day a great deal about electric heating. The Shawinigan Company has for several years carried out experiments in electric heating of houses, and while this data has been crudely gathered, nevertheless there is available a pretty good indication of the facts. The basic principle of electric heating is that electricity can be turned into heat and distributed through the room at 100 per cent. efficiency, whereas coal or other sources of heat can only be turned into usable heat and distributed at some fraction—say probably 50 per cent.—efficiency, but never forget that 1 kw.h. fundamentally and absolutely has only the intrinsic heat value of one-quarter of a pound of good coal, and that it only has the equivalent heat value of about one-third or one-half of a pound of coal when burned in the ordinary manner. So we cannot hope in the future for more efficient use of electricity for heating except in the distribution of the heat; that is, no electric heater will give or put into the room more heat than there is in the electricity, and almost any kind of electric heater from the standpoint of heat alone, not long life or ease of operation, is the equivalent of any other.

Most of us have been working on electric heating as an off-peak proposition, realizing that it must be done with cheap electricity to succeed. Now, an off-peak proposition can only be worked when the ruling load is bigger than the off-peak load. The data from electrical distributing companies shows that the average city house takes a maximum demand of about 400 watts on the average—say, one-half a kilowatt. Our experiments on electric heating of houses show that the average house requires about 20 kw. of maximum demand, or of almost continuous demand in cold weather, to keep it warm, and this with properly designed heaters. You can see, therefore, that electrical heating can never be an off-peak load unless some other load can be developed which would be off-peak to it, and sold at a very low price.

We also find that it requires some 30,000 to 40,000 kw.h. a year for heating the average house, and this in the winter time, when our hydraulic powers are at their lowest. Let us see what this means in horse power. To be ultra-conservative, let us say that instead of 20-kw. the average house would only take 20 h.p. Now the city of Montreal has roughly 125,000 houses—say 100,000. Now, 100,000 houses at 20 h.p. per house is only 2,000,000 h.p., a figure which is greater than the entire hydro-electric power of Canada to-day, and in fact, there is not enough hydro-electric power developed in the entire continent of North America to-day to heat the little province of Quebec.

But now let us examine what this would cost. With some knowledge I could say that on this tremendous scale electricity could not be delivered to your door for less than $20 per h.p. for the season's service; that is, the average householder would have to pay $400 a year, or the city of Montreal householders would have to pay $40,000,000 a year for heating their houses, whereas actually they pay, at $10 coal, not over $7,000,000; that is, there is quite a margin between electrical heating of the houses of Montreal and heating them with coal, but you say—"What would we do if we had no coal?" The answer is, there is always commerce, and while there is commerce there will be coal—at least in our day and generation—and if instead of using this tremendous amount of power for heating purposes, which we electricians call low grade purposes, let us use it for high grade mechanical, electro-chemical and electro furnace processes, which would make this country the most important country in the world in this regard, and would probably add tremendously to our wealth.

The city of Shawinigan Falls to-day uses 100,000 h.p. and exports from Canada yearly products amounting to $20,000,000; that is, holding the same proportion, the 2,000,000 h.p. required to heat the city of Montreal would bring to this country as a favorable trade balance twenty times $20,000,000, or $400,000,000 per year, whereas it was shown that $7,000,000 would have purchased the coal which this tremendous amount of power would have made unnecessary.

Is there any heal argument in favor of electric heating when it means the sacrifice of valuable electricity, valuable in producing new chemicals, new products, in increasing the wealth of this province seventy times the value of the electricity used as heat? After the war we are going to face debt—the interest on debt. It is only by favorable trade balance that this can be remedied. Let us, therefore, get together and boost for the big thing, not the selfish heating of our houses, but for the development of these water powers and the use of this power for industrial purposes to increase the wealth of this country.

The Canadian Bridge Company, Limited, of Walkerville, Ont., announces the appointment of Mr. John W. Seens, as sales manager, with offices in New Birks Building, in Montreal, effective May 1st, 1918. Mr. Seens was for the past seven years manager of the Structural Steel Company, Limited, of Montreal, until that company discontinued operations the latter part of last year, on account of being obliged to surrender their leased shop. During the period under Mr. Seens' regime the Structural Steel Company successfully carried out the fabrication and erection of many of Montreal's largest buildings. They also furnished a large measure of the steel work in connection with the large paper mill development in Quebec and Eastern Ontario in recent years. Mr. Joseph Labelle, formerly designing engineer of the Structural Steel Company, Limited, has been retained as sales engineer in the Montreal office of the Canadian Bridge Company, Ltd.

Possibilities of the Relief of Fuel Consumption by Increased Use of Hydro-Electric Energy

By J. M. Robertson*

The growing necessity for some comprehensive plan looking towards the more complete and efficient utilization of our resources has been apparent for many years to those whose duties make them familiar with the tremendous wastage of materials which results from the lack of coordination in the use of the various raw materials with which our country is so richly endowed. The public, generally speaking, has little real idea as to what constitutes the essential of conservation of natural resources. Simple reduction in demand, the restriction of the use of such materials, thereby restricting the output of essential industries is obviously not true conservation. The goal to be aimed at is development, present and future, and in order to secure this end we must make use of such materials as are necessary for the maintenance of our trade and commerce and the growth and development of our national life. Economic utilization of such resources, considering both present and future, would limit the use of irreplaceable materials even though they might be more cheaply and readily obtained under given conditions, and promote the use of other materials whose use conserves to a greater extent the assets of the community.

Consider Other Factors Besides Cheapness and Availability

The elements of cheapness and availability of raw materials are large factors in determining the success or failure of any industrial enterprise, and as such must be given due weight. We have been, however, and we are still, too much inclined to accept these factors as excuses for taking the material nearest at hand which is suitable for our purpose and letting the future take care of itself. A little thought and investigation devoted to the development of possible substitutes will frequently disclose methods by which an industry may utilize materials or processes the use of which does not deplete the resources of the country. The ideal conservation would provide for the maintenance of the industries of the world by the use of basic materials supplied from natural growth so that the stock of raw material which constitutes the capital of the world would not be reduced but would be handed down unimpaired from generation to generation.

Such an ideal conservation is obviously beyond reach in our present stage of development, but, although we are still using up our capital at an alarming rate, the increasing realization of the need of care and the increasing efficiency of utilization which science is placing in our hands makes the future look more hopeful than might be considered warranted by a consideration of the special and temporary restrictive measures which have been applied to industry as a whole during the past few months. From these experiences it is apparent that the most essential elements in our industrial life at present are transportation and fuel, and to a large extent transportation means fuel, since the equipment required for transportation can neither be produced nor operated in the absence of an adequate supply of fuel. It therefore follows that any modification of our past practice which will maintain our industries and at the same time reduce the consumption of fuels will be an application of true conservation principles in more than one way, as first, it will reduce the consumption of a material which once used cannot be replaced, and secondly, it will reduce the demand for transportation for such material and will thereby leave for the use of some other industry a larger supply of raw material for which for its purposes there is no substitute.

Use of Raw Coal for Power Generation Uneconomic

The use of raw coal as a basis for the generation of power through the medium of steam is fundamentally uneconomic, as too large an amount of valuable by-product is sacrificed for very little return, and the efficiency of the conversion is much too low. When it is considered that under average conditions the amount of coal required to generate a horse-power hour is of the order of five or six pounds, representing an efficiency from coal to power of only three or four per cent., which, generally speaking, must be again divided by two before the energy is applied to the work it can be readily realized that our present methods of operation leave much room for improvement. In defence of the steam plant it may be claimed that such figures represent only the practice of the smaller plants and that in the large manufacturing centres power is supplied from steam plants which operate much more efficiently. It is a very good plant which can average a kw.hr. on 1½ lbs. of coal, including all auxiliaries, so that even under the best conditions we get an efficiency only about 15 per cent. It is, of course, necessary to remember that such low efficiencies are not due to imperfections in the equipment, but rather to the limitations imposed by thermal laws, and until a method of conversion radically different from the present has been discovered such losses cannot be eliminated.

These figures, unsatisfactory as they are, tell only half of the story. In using raw coal we are throwing away in a wasteful manner material which contains many valuable by-products which add but slightly to its value as a fuel, but which when extracted have a value greater than the value of the coal itself. Many of these materials are essential elements in our industrial life for which at present there are no substitutes.

Notwithstanding this very unsatisfactory showing, the necessities of the case require that coal should be used for fuel in the absence of better means of providing readily available energy. It would seem, however, more or less elementary that the use of coal for such purposes should be restricted to cases where no substitute is available in order that when science places in our hands improved means of converting fuel into power, we shall not be in the unfortunate position of having squandered our patrimony and left ourselves without the means to take advantage of the improved processes when available.

Generate Power Before Using Steam for Heat

Climatic conditions in this country owing to the northern location impose upon us a heavy burden every winter. Heat must be maintained in our houses and shops. At this stage of progress the only generally available means of heating is by fuel—coal, oil or gas—of which the former is by far the most important. We cannot avoid the use of coal for heating our factories, but we can see to it that as soon as practicable raw coal is not used for this purpose, and that what fuel is used is for heating purposes only wherever adequate substitutes for coal generated power are available.

*Consulting Engineer, Montreal, Que. before Professional Meeting, Can. Soc. C.E.

many of our industrial establishments are operated entirely by coal simply because the controlling head likes the idea of "independence," and declines to consider the purchase of public service supply because he would then be "dependent on the power company." In places where hydro-electric service is available the power required by such establishments should be purchased and generally is purchasable at rates and under conditions more favorable than the costs of operation by coal and with much less investment for plant. In the cases of factories located where such service only is obtainable sufficient engine plant should be installed to make possible the abstraction of the maximum amount of energy from the steam before it is used for heating, the idea being to operate steam plant only to the extent of the heat requirements utilizing the steam equipment as the reducing valve and increasing or decreasing the purchased power to such an extent as may be required to offset the variation in the by-product power recovered from steam required for heating or process work.

As the average manufacturing establishment in most parts of Canada requires more steam for heat than for power during the winter months and almost no steam during the summer months, and as the demand for electric energy for lighting purposes is much greater during the winter, such an arrangement works to the advantage of both company and consumer as the combination makes possible the almost ideal utilization of the energy in the fuel during the winter and the capacity on the power system thus released becomes available to take care of the increased load which must be carried electrically. The diversity thus introduced into the power demand makes possible the fixing of a power rate which is attractive to the consumer, and, at the same time, remunerative to the power company.

In some plants considerable ingenuity is displayed in so combining equipment for utilizing steam, electricity and compressed air or refrigeration with outside service so that no fuel whatever is burned, except for supplying heat, and every possible unit of energy is abstracted from the steam before it is utilized as heat. Variation in the demand for air and electricity is compensated for by use of machinery driven by two sources of power involving very interesting cross conversion of energy.

The experience of those who have plants operating under these conditions is quite satisfactory as they have secured the convenience of freedom from unnecessary heat and dirt during the summer, the advantage of a standby plant as protection against shut down—extremely low cost of power during the winter and a satisfactory power service available at all times when required.

The fact that such economies are usually realized in plants of considerable size is due principally to the fact that the large plants are directed by executives of broad views who realize that elimination of waste is desirable even though in a given case it may not result in a net saving of money.

Instances have arisen this year in which factories which operate by steam power in winter and purchase hydro-electric power during the summer months have anticipated the date for the commencement of this purchased service with the consent of the power company, and are reducing their coal consumption as weather permits, to the minimum absolutely necessary for heat, and are paying to the power company for service to make up the deficiency in power recovery the net amount they would have paid for additional coal. The power company having power available is satisfied to accept this amount for temporary service from month to month without further obligation on the part of either party. Such co-operation shows evidence of broad-mindedness on the part of all concerned and leads us to hope that further progress in co-operation would develop many other instances in which very real savings could be made to the advantage of the country as a whole.

An indication of the extent to which an enlightened policy under favorable conditions can carry the substitution of hydro-electric service for steam in an industrial community is given by a comparison of the figures representing the consumption of electrical energy in the more important industrial centres in America. For the year 1916 the figures in kw. hours per head of population were as follows:—

New York, 225; Philadelphia, 250; Boston, 350; Cleveland, 400; Minneapolis, 450; Pittsburg, 500; Buffalo, 586; Toronto, 700; Montreal, 783. The figures for 1917 are not yet available, but it is probable that the figures for both Toronto and Montreal would show an increase of about 10 per cent. Montreal would thus be about 800, while the whole province of Quebec was about 700.

The total power utilized in the Montreal district is about 200,000 h.p., of which about 165,000 is supplied from hydro-electric sources and the balance by steam. If the city pumping plant and the plant of the Tramways Company are excluded, the total steam capacity now in regular operation in this territory would be about 10,000-12,000 h.p., or about 5 or 6 per cent. of the total power utilized. Even this small part of the demand would be reduced materially were it not for the fact that most of these plants are of a kind which produce large quantities of combustible waste which must be disposed of by burning or are plants in which there is relatively large demand for high temperature steam for process work and a relatively small demand for power.

When it is considered that the amount of coal required to replace the electrical energy supplied by these hydro-electric plants would be of the order of 1,750,000 tons per year it is clear that while there still remains much to do a very considerable amount has been done.

It should be borne in mind that this is no isolated instance, what has been done here is being done to a greater or less extent in many other centres as is clear from the large and increasing load carried by the Hydro-electric System in Ontario. Toronto's use of current is almost equal to that of Montreal, and both of them are quite remarkable for very complete utilization of purchased power. Co-operation between the consumer and the company with fair rates and conditions for service rendered, and a reasonable willingness on the part of the consumer to adapt himself and his plant to new conditions, even when such adaptation may perhaps entail the sacrifice of a little of his apparent independence, will assist our power companies in improving the already high character of the services they are now rendering by reducing to a minimum the utilization of irreplacable materials and extending and broadening the use of power from inexhaustible natural sources.

The development and utilization of our water power reserves is a measure of our economic advance in the scale of civilization, and the formulating of a broad and liberal policy which will ensure the keeping of such development in advance of the requirements of our industries is something which should engage the attention of our government and our industrial leaders.

It is surely not too much to hope that in a country so richly endowed with natural power sites, distributed almost ideally from an economic standpoint, the time will come when practically all of the power required for our industrial life will be supplied from such sources, and we will be free from the reproach that because it is easy and obvious we cheerfully squander our patrimony while we neglect to develop the natural heritage with which a wise Providence has blessed us.

The Dealer and Contractor

Toronto Electrical Contractors Doing Their Share in Co-ordinating the Electrical Interests

The Toronto Electrical Contractors' Association varied the proceedings at their regular monthly dinner and meeting on May 2, by inviting representatives of the central station, manufacturing and jobbing interests to be present. The invitation had been generally accepted and the attendance was unusually large. This is undoubtedly a move in the right direction—the Goodwin direction—which means a co-ordination of all the various electrical interests working, in harmony for the good of the industry—and, indirectly but surely, the good of the individual.

The chief interest and discussion centred around the agreement which the Executive of the association had just concluded with the Union. The Executive have been working hard to reach a more cordial understanding with the workmen, and there is good evidence in the agreement that the men are gradually coming to realize that antagonism to the contractors' association is a mistake. The association stands for better work, better prices, better conditions. They are working hard to remedy certain trade evils which, when removed, will benefit the workmen quite as much as the contractor. For that reason there should be only the closest co-operation between the Union and the association. The agreement as accepted by both parties is printed on the following page.

A request had been received from the Electrical Section of the Board of Trade that the Toronto Electrical Contractors' Association name a representative on the Rules and Regulations Committee of the Hydro-electric Power Commission of Ontario. Mr. Geo. J. Beattie was elected to represent the association.

The next meeting of the association will be held on June 6. This will likely be the last meeting of the season and a full attendance of contractors is expected.

The election of officers for the coming year, which was held at the May 2 meeting, resulted as follows: K. A. MacIntyre, president; Harry Hicks, vice-president; E. F. W. Salisbury, secretary; J. Everard Myers, treasurer; Executive Committee: E. A. Drury, Harry Rooks, R. A. L. Gray.

Rates Are Difficult to Understand

A correspondent, a central station man, who has operated on a flat rate of charge ever since his plant was put in operation some thirty years ago, and who finds that this method is not satisfactory under present-day conditions, writes us as follows:

"I have before me the Electrical News of recent date in which you have gone into an analysis of the new rates made by the Hydro and the T. E. L. Company, but do not understand what is meant when you speak about commercial lighting by saying: 'First 30 hours' monthly use of demand, 5 cents; next 70 hours' monthly use of demand, 3 cents; balance monthly consumption, 1 cent.'

"For example, take a store in this town open two nights a week. How is the number of hours burned to be computed? Is it estimated or measured with some kind of a clock? Then, say, this store has been lighted 100 hours. Does this mean that in the first 30 hours there is to be so many kilowatt hours allotted at the first rate and in the next 70 hours likewise?"

The answer to this question lies in the meaning put on the word "demand"—that is, the maximum demand, or, in other words, installed capacity. When we speak of the first 30 hours' use of maximum demand, or installed capacity, it does not mean that the full capacity has been used during the exact period of 30 hours, but that the equivalent amount of current has been used. For example, a man may have an installed capacity of 5 kilowatts. In his case the first 30 hours' use of maximum demand would be 150 kilowatt hours, whether he used it during the first 30 hours or during any longer period. For example, he may only use this amount over the whole month. In the same way the next 70 hours' use of maximum demand represents a consumption of 350 kilowatt hours, as shown by his meter, the time during which it was used being immaterial. It will thus be seen that the ordinary meter is the only instrument required where such a rate is used.

In certain specific cases conditions of operation may be such that the maximum demand is less than the installed capacity. Under these circumstances, an arrangement mutually satisfactory to the consumer and the central station must be made on some other basis.

Power Plant Farthest North

A 45-kilowatt hydro-electric plant for light and power in the town of Chitina, Alaska, has just been put in operation. It was built by the owners, O. W. and M. S. Nelson, has been under construction for two years, and represents an outlay of $22,000, making it probably the highest priced, per kilowatt, plant in the world One of its distinctive features is that it is the farthest north of any year-round hydro-electric plant on the continent. Adjacent to the town of Chitina is a three-acre lake, which is fed by a number of springs, of such mildness that the lake does not freeze to any considerable depth even in the coldest weather. This lake is 100 feet above the Copper River and separated from it by a ridge. By driving a 1,400-foot tunnel through this ridge the water from the lake is carried over to the Copper River side, where it is dropped down a hundred feet through 270 feet of 16-inch steel pipe. The tunnel was driven through 900 feet of frozen earth and loose rock and through 500 feet of extremely hard, solid rock. The earth and rock were thawed with steam points.

Non-Twist Canopy Ring

A new invention eliminating the necessity of the objectionable slip canopies has been provided by T. D. Parmenter, of the Colonial Fixture Company, Ltd., which will be known as the "Non-Twist Canopy Ring." Full information and description will appear in a later issue.

Toronto Electrical Contractors' Association

WORKING RULES

1. Adopted by the Toronto Electrical Contractors' Association, for the guidance of its members, on May 2, 1918, in force from May 1, 1918, to May 1, 1919, and agreed to by Toronto Local 353, I.B.E.W. These rules are to be posted in the shops of the members.

2. Eight hours' labor shall constitute one day's work. All labor over eight hours per day shall be paid for at the rate of one and one-half hours' pay for each hour's work; work performed on Sunday and legal holidays shall be paid for at the rate of double time. All men shall be on the job, ready to commence work at the regular hours for starting work, which shall be between 8 a.m. and 5.00 p.m. Saturday to be a half-holiday; Saturday work between 12.00 noon and 5.00 p.m. to be paid for at the rate of time and one-half; and double time thereafter until relieved.

When workingmen are required to report at the shop, they shall report not later than 7.50 a.m., and shall be ready to receive orders or supplies. Failure to comply with this shall result in a reduction in pay for the time lost, and, if men are instructed to report at the shop for work and are not sent on a job, they shall be paid for two hours' time.

3. The holidays shall be legal and statutory holidays.

4. The help employed shall be divided into three classes: Journeymen, Junior Journeymen, and Helpers.

Journeymen shall have served at least your years at the trade, and shall have qualifications at least as required by the by-laws of Local 353.

Junior Journeymen shall be helpers who have served at least three years at the trade, and shall have qualifications at least as required by the by-laws of Local 353, and who shall be allowed to work for one year under instructions; that is, he shall be allowed to work as a Journeyman, but shall have no one but a helper under his supervision. Employers shall be entitled to employ one Junior Journeyman for the first four Journeymen and one for each four thereafter.

Helpers shall be those who have served at least one year at the trade. There shall not be more than one Helper for each Journeyman on any job. An employer shall have the right to employ one apprentice if employing four men on the average during the year.

5. The minimum wage of Journeymen shall be 55c per hour, and all Journeymen receiving now (April 1, 1918) more than 50c per hour shall receive a 5c per hour increase. (Employers are advised to satisfy themselves, when employing men, that men representing themselves as Journeymen are really qualified as such).

The minimum wage for first-year Helpers (one-year experience) shall be 25c per hour.

6. All carfare, other than that to reach the job or shop within city limits and return to his residence, shall be paid by the employer, either in cash or car tickets, at his option. All workmen working on jobs beyond the present city limits shall take car going to or return from work, which arrives at the present city limits as near 8 a.m. or 5 p.m. as car schedule will permit.

7. The Toronto Electrical Contractors' Association shall appoint two members to act with two members of Local 353 as a Joint Examining Board.

8. No employer of labor for the installation of electrical work shall be given any better terms or conditions regarding hours of labor, wages per hour, etc.

9. Employers, in case of work outside of Toronto, shall pay suburban car, railroad, or boat fare, and all expenses for room and board.

10. There shall be a Conference Board, consisting of three members of Local 353 and three members of the Toronto Electrical Contractors' Association. This Conference Board shall meet at least once each month, or at call of their chairman. All complaints by employer or employee, or covering labor conditions, must be submitted to the Board in writing. The Conference Board shall also work out and put into effect rules governing extra compensation to foremen. Rules and Regulations to govern the Board's transactions shall be made by the members thereof.

11. Any Journeyman, who shall do any work in violation of the Electrical Inspection Department's Rules, or in such manner so that it will not pass inspection, shall do said work properly on his own time and expense, or pay for same being done. (It being understood that, if such work is done by order of the contractor, the contractor assumes all responsibility as to it being passed by the Electrical Inspection Department, and expense for making work right). In the event of a Journeyman refusing to comply with this provision, the matter shall be referred to the Conference Board for investigation and, if the Journeyman be found responsible, the Local shall compel him to comply with said provision.

History and Development of Investigations Into the Nature of Light

By Mr. J. F. Heffron

Light plays so important a part in the life of man it is not strange that speculation as to its nature, and investigation of its laws, should have commenced at an early period of the world's history.

In their investigations and experiments, the ancients were seriously handicapped because they lacked the optical instruments so necessary to any scientific study of its phenomena. Hence they were unable to formulate any reasonable optical theory. All the refinements, both of construction and theory, may be said to have taken place within the last three hundred years.

Metallic mirrors, one of the simplest of man's devices to reflect light, are of very ancient origin. Many of these have been recovered from ancient Egyptian tombs, and we find that they are distinctly mentioned in the books of Exodus and Job. Burning glasses in the form of globes of water, or of glass, were also known at an early date. Aristophanes makes mention of them in a comedy of his which was performed about 424 B.C. But of optical instruments more delicate than these, we may reasonably assume that the ancients knew practically nothing.

It is surprising, therefore, to find that Pythagoras, the Greek philosopher, who died about 520 B.C., formulated one of the earliest, and at the same time one of the most reasonable theories in connection with the phenomena of sight. He believed, as did Sir Isaac Newton 2,000 years later, that the sensation of sight was caused by minute particles of some sort, being continuously shot out from luminous sources, which particles were supposed to in some manner enter the pupil of the eye.

We find Plato, with whom Greek philosophy attained to the culminating point of its development, speculating on the subject, but his hypothesis is so fantastic in its nature that we are unable to form any definite idea of his meaning, for, in addition to the lack of instruments so necessary in the observation of natural phenomena, the speculation of the Greeks had little or no basis on exact observation of nature, and was not supported by a patient mastery of natural law. They made many brilliant suggestions, but later generations did not, as in our times, immediately test and develop these suggestions by actual observation of nature, so that the dawning light of truth was not disclosed until many centuries had passed during which these early suggestions were lost sight of, and forgotten.

The Platonists were acquainted, nevertheless, with two very fundamental laws of light. They were aware of the fact that light travels in a straight line when it travels in a homogeneous medium, and were also aware that when a ray of light is reflected at any surface, the angle between the incident ray and the reflecting surface is equal to the angle between the reflected ray and the reflecting surface.

Ptolemy, the Egyptian astronomer, about 150 A.D., investigated the refraction of light both by glass and by water, but although he measured and tabulated the angles which the beam penetrating the glass of water makes with the surface, corresponding to certain angles which the incident beam makes with the surface, he was unable to determine the law which connected them.

Passing over centuries of inactivity in the realm of physics, we find Albazen, the Arabian, in the eleventh century, making a real advance in his description of the anatomy of the eye. He was able to show how it produced an image of external things on the retina. He also accounted for twilight, and for binocular vision, and made some real progress in the mathematical theory.

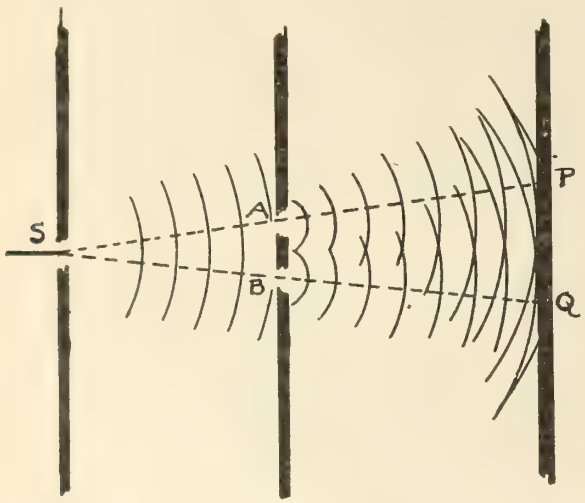
Little progress was made after this until the invention, in 1608, of the telescope, by Hans Lippershey, a spectacle-maker, of Middleburg. A little later Galileo independently constructed another telescope and, later still, about 1615, Kepler demonstrated how the magnifying power of the telescope may be calculated from the focal lengths of the lenses employed.

Snell, a professor of mathematics at Leyden, in 1621, discovered the laws of refraction which Ptolemy had been unable to deduce from his experiments, and died in 1626 without having published his results. Later, Descartes, having perused the dead Snell's papers, published the discovery as his own.

Glancing over the latter part of the seventeenth century we find that it was a period of extraordinary activity and advance in the science of optics. Now possessing finer instruments and the accumulated knowledge of those who had gone before, we find that scientists during the fourteen years from 1665 to 1678 made more important discoveries than had been made in all the preceding fourteen centuries, and it is these discoveries which mark the beginning of our present knowledge of the nature of light.

In 1665 Grimaldi published a treatise on light, in which he gave an account of some interesting experiments on "Diffraction" which name he applied to a small spreading out of light in all directions upon its admission into a darkened room through a small orifice. This spreading out of the light, he maintained, shows that it bends around corners the same as does sound, but, of course, to a smaller extent.

Newton's Investigations



Sir Isaac Newton, in 1666, discovered the decomposition of white light into its component colors by means of a prism which he had chanced to purchase at Stourbridge Fair. He showed that no further colors were produced by a second refraction through a prism. He showed further, that when the component colors were recombined they once more produce white light. Newton explained that white light consisted of a mixture of the component colors, and that the function of the prism is to separate the components. Oddly enough this view, one of the most important beginnings of our modern knowledge of light, is one that we must abandon in favor of the view that the prism actually manufactures the different colors out of the white light, and we also have a pretty clear idea of how the manufacture is carried out.

Newton, when he for the first time projected the pretty rainbow tints of the light passing through the prism upon the wall, little suspected, even with his great mind, how that phantom riband of gorgeous colors would one day be called upon to draw many secrets from the messenger of the heavens traversing space in his thousand-league boots, secrets that scientific men of former times did not conceive of in their wildest dreams, and we may well suppose that the spectroscope has not yet told its entire story to man.

Newton carried on his experiments and finally developed with remarkable ingenuity the idea that light consists of exceedingly minute particles shot out from a luminous body, causing the sensation of sight when impinging on the retina.

This became known to the world as the "corpuscular theory of light," and, strangely enough, is the same as that advanced by Pythagoras, 2,000 years before. Newton's exposition of the theory was so masterly and his authority in the world of science so great, that with this theory he was able to retard the development of the later wave theory for fully a hundred years.

The wave theory, of which Huygens may be regarded as the author, and which became known as the "Undulatory theory," first appeared in 1678; it then supposed light to consists of waves of some sort emanating from a luminous surface. Huygens showed how reflection and refraction follow naturally from such a theory, but unfortunately was not able to show why light bends round corners so little. The

Dr. Young's experiment is diagrammatically represented above. Light of a certain wave length is admitted at a narrow slit S, and is intercepted by a screen in which there are two narrow slits, A and B, parallel to the first one. A screen receives the light emerging from the two slits. If the old corpuscular theory were true there would be two bright bands of light, the one at P and the other at Q, but instead Young observed a whole series of parallel bright bands with dark spaces in between them. Evidently the two small fractions of the original waves which pass through A and B spread out from A and B and interfere just as if they were independent sources.

answer to the objection now is, that light does bend round corners though only slightly, and that the smallness of the bend is quite simply due to the extreme shortness of the light waves. The longer waves are, the more they bend round corners. This can be noticed in any harbor with a tortuous entrance, for the small choppy waves are practically cut off, whereas a considerable amount of the long swell manages to get into the harbor. Huygens was unable to demonstrate this, and consequently the wave theory made little headway for over a hundred years.

Young, early in the nineteenth century, discovered the principle of interference. He was able to show how a beam of light may be divided into two portions, which under certain conditions will produce darkness when both portions illuminate the same point. As this follows quite naturally from any wave theory, as is more fully explained later on in this article, but would be inexplicable by a corpuscular theory, the long rivalry between the two theories came at last to an end, and the corpuscular theory was forced to yield entirely to the undulatory theory from this time onwards.

If light consists of waves they must, of course, be waves in some medium, and since light travels across space in which there apparently is no matter, we must suppose that the whole of space is filled with some unseen medium.

Much speculation as to the nature of this medium, which has been termed, in our day, the ether, has been indulged in. Even the ancient Greeks attacked this problem, and one of the chief ambitions of the early Greek evolutionists was to discover some one primitive substance or principle from which all the contents of the universe had been developed.

Huygens conceived of this medium as a kind of elastic solid, through which the vibrations of a luminous source are transmitted in much the same way as the vibrations of a marble embedded in a jelly are transmitted through the substance of the jelly.

This idea served for some time, and will, of course, still serve for those properties which light has in common with all other forms of wave motion, but it breaks down when properties involving the actual character of the waves are considered.

In the revival of scientific speculation Descartes recurred to an idea advanced by the brilliant monk Giordano Bruno, who was burned at Rome in 1600. Bruno had suggested that whirlpools or eddies in this ocean of ether might account for the movements of the heavenly bodies; just as corks swim round and round in the eddies of streams. As science advanced the theory of ether received a more solid justification. Experiment showed that the air in a particular portion of space—say, in the chamber of an air pump—might be withdrawn, yet something remained. A bell placed in the exhausted space may continue to work, yet no sound comes from it; but it remains visible, and so something must proceed from the bell to the eye. It was suggested, therefore, that a very fine all-pervading fluid remained, and the name of ether was eventually given to it. When the balloon was invented, and it was found that the atmosphere became thinner as one ascended and must cease altogether at about 200 or 300 miles above the surface of the earth, it was seen that something must occupy the vast regions of space beyond, in order to transmit light and electrical energy to us. Again, the ether was invoked, and light, heat, and electricity came to be regarded as wave-movements, of inconceivable rapidity, in this ether.

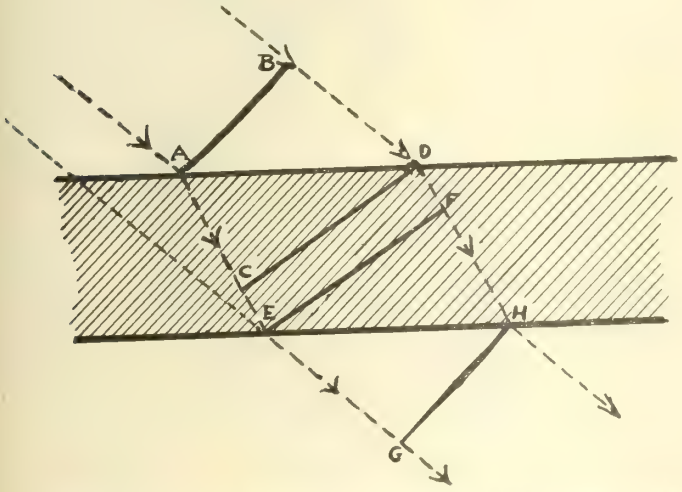
It was Clerk Maxwell who demonstrated the solidity of the theory of the ether when in 1873 he propounded his electro-magnetic theory and showed that the ether which was required for the transmission of light, was also required for the transmission of electric and magnetic actions, and that the known laws governing electric and magnetic actions, would lead to electro-magnetic waves, which have all the characteristics of light. When by the method of interferences the illustrous physicist Hertz was able to prove that electro-magnetic induction did not take place instantaneously as had until then been supposed, but according to Maxwell's theory propagates itself with the velocity of light, the issue was decided and it became known that the same fluid, the ether, which is the medium of luminous phenomena, is at the same time the vehicle of electrical action.

The Wave Theory of Light

We see, therefore, that the "undulatory," or wave theory of light took the place of the "corpuscular," or emission theory, because the latter theory was found inadequate to explain certain of the phenomena of light, of which the undulatory theory yielded a satisfactory interpretation.

The chief importance that the establishment of the undulatory theory of light held, lay in the part it played in the discovery of the existence of the luminiferous ether. We are now forced to the belief that all space, including intramolecular space, is fitted with an imponderable substance capable of transmitting vibrations, and hence that light is the immensely rapid molecular vibration of the illuminating body, which vibrations are transmitted through space by means of the corresponding vibrations of the imponderable substance pervading it.

The discovery of the real existence of this "ether" is



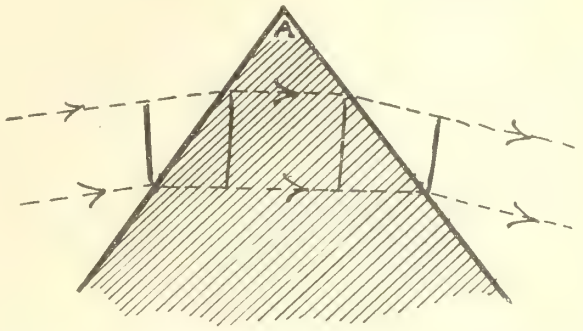
one of the great achievements of the Victorian era. Its character and mechanism are not yet known to us, for all attempts to invent a perfect ether have proved beyond the mental powers of the highest intellects, but the difficulty we experience in trying to picture to ourselves the nature of ether does not disturb our certainty of its existence. We have to attempt to picture it in terms of our experience, and our experience is confined to material things—that is to say, to what is called "ponderable matter," which has very different qualities. Optics is now a most elaborate science, filling volumes with its experiments, observations, and deductions. All these experiments proceed on the supposition that light is an electro-magnetic undulatory movement in ether, and there is not a single observation or result of experiment that does not harmonize with the theory.

We must then, for the present, be content with a knowledge of the fact that the ether exists, and must have existed from the beginning of the transmission of energy in all its forms, that it transmits these energies in definite waves and with a known velocity, that it is perfect of its kind, but that it still remains as inscrutable as gravity or light itself.

Some Characteristics of Light

We have seen, therefore, that any disturbance of the ether must originate with some disturbance of matter. An explosion, cyclone, or vibratory motion may occur in the photosphere of the sun. A disturbance or wave is impressed on the ether. It is propagated in straight lines through space. It falls on Mercury, Venus, the Earth, and every other planet or particle of ponderable matter met with in its course, and any mechanism, human or mechanical, capable of responding to its undulations indicates its presence.

Thus the eye supplies the sensation of light, the skin is sensitive to heat, the galvanometer indicates electricity, the magnetrometer indicates disturbances in the earth's magnetic field. We may look upon the magnificent generalization of



Refraction by Parallel Plate. If a plane wave passes through a plate of glass with parallel surfaces it is evident that at the second surface it will be deviated through the same angle into the original direction, the wave being simply displaced sideways by its passage through the plate. AB, CD, EF, and GH, in Fig. 2, represent successive positions of the wave-front passing through the plate, which is shaded. The amount of sideways displacement depends upon the obliquity of the wave to the surface as well as on the thickness of the plate. The displacement is evidently zero when the wave is parallel to the surface and is greatest when the obliquity is greatest, i.e., when the wave-front is almost perpendicular to the surface.

Clerk Maxwell that all these disturbances are of the same kind, differing only in degree, as one of the greatest scientific achievements of our time. Light is an electro-magnetic phenomenon, and electricity in its progress through space we find follows the laws of optics.

Accepting, therefore, the undulatory theory, we may briefly summarize the leading points in the science by considering the salient characteristics of a ray of light.

We have observed that light travels in waves, or a periodically recurring displacement or disturbance from a condition of staple equilibrium. These displacement waves occur in the luminiferous medium or ether. When extremely short, they are generally known as ultra-violet light, and are invisible to the human eye, when longer they form visible light; and longer still, they once more become invisible and produce radiant heat waves; while beyond that they form the

Refraction by a Prism.—If the second surface of the plate is not parallel to the first we have a prism. After passing through a prism the direction of the wave is altered as well as being shifted sideways, for the wave on reaching the second surface is not inclined to it at the same angle as it was to the first surface and therefore it will not be bent back by the same amount. Fig. 3 shows successive positions of a plane wave-front passing through a prism.

Hertzian waves employed in wireless telegraphy. These waves when produced in a modern wireless apparatus are miles in length.

Any wave which is propagated in a medium possesses three principal features. It must have (1) a certain wave-length, just as waves in the ocean have a length when measured from crest to crest; (2) a certain period, i.e., the time taken by any portion of the medium affected by the wave to describe one complete vibration; (3) a certain amplitude, i.e., the distance on each side of the position of undisturbed rest through which the portion of the medium vibrates to and fro, and corresponding, in the case of ocean waves (to continue the metaphor of a wave), to the height of the crest or the depth of the trough, measured from the ordinary undisturbed sea-level.

Combining the first and second of these characteristics, it is seen that the velocity of propagation of the wave, as a whole, will be equal to the wave-length divided by the period. So delicate is the apparatus of research used by the modern physicist that it has been possible to measure the length of these waves (from crest to crest) and it is found that the waves which are calculated to make an impression on our organs of perception range between the 1-40,000th and 1-80,000th of an inch. In other words, they must impinge on our nerves at the rate of between four hundred and eight hundred billion per second. That there exist wave-lengths which lie beyond the visible part of the spectrum, and which are either too short or too long to affect the retina of the human eye, is a fact well known to all students of physics.

The different periods of light waves can be deduced from the relation to the speed of light. The term frequency is used occasionally instead of period; it stands for the number of vibrations per second, and therefore is the reciprocal of the period, while the amplitude of a light wave is the factor which governs the intensity of the ray, for with light of a given wave-length the energy in the ray is proportional to the square of the amplitude. The speed of light in its movements through space has been determined by different methods, each of which show that its most probable value is about

186,000 miles per second, and that it is the same for all wave lengths.

From the fact that light consists of an undulatory motion in the ether, it is possible to explain the important phenomena which arise when rays from two separate sources meet at a point.

Analogous cases can again be found in ocean waves and the phenomena of the tides. If, owing to any cause, two series of waves from different sources affect the same water surface, there may occur the case where crests of waves in one series unite with crests of the other series. In this case the resultant wave has an amplitude equal to the sum of the component amplitudes.

But in the case where the crests of one series meet the troughs of the other, the resultant amplitude is the difference of the component amplitudes, and if these are equal there is no disturbance of the sea-level.

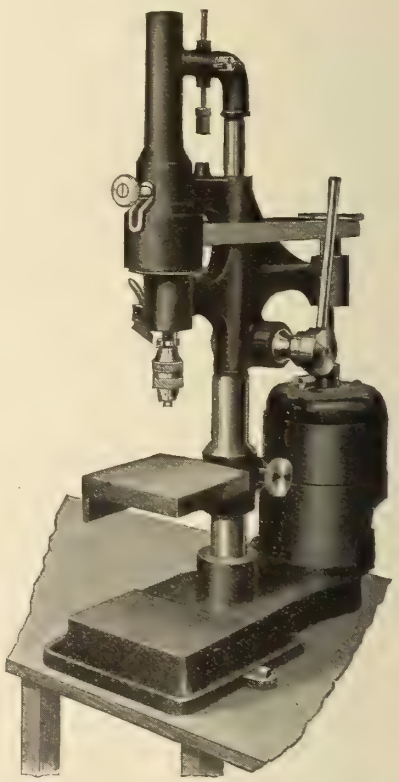
Similarly, it is quite possible to produce a combination of rays which will give either increased or diminished brightness. This is known as interference, and is illustrated by Fig. 1.

Another group of phenomena is due to the fact that the vibration of the ether, being perpendicular to the direction of the ray, may be confined to one particular plane. The light is then said to be polarized in that plane. Further, since harmonic motions in directions inclined to each other can be combined so as to produce circular or elliptic motions, we can combine polarized rays in a similar manner. So long as a ray travels in the same homogeneous medium, it does so in a straight line. But when it arrives at the surface of separation between two media which are optically different, a change takes place. One portion of the ray may be thrown backwards into the medium in which it has been travelling, and is thereby reflected, while another part may be reflected in a diffuse or irregular manner, and it is by this diffuse reflection that we see most objects which are not self-luminous.

A third part may pass into the second medium, but in doing so its direction suffers an abrupt change, and is said to be refracted, or bent. This peculiar property of light is made use of in the use of the prismatic lens to direct light in the direction desired, and is illustrated in figures 2 and 3.

Lastly, a certain portion may be absorbed by the second medium and its energy transformed into heat. A perfectly dull black surface may be said to absorb all the light which falls upon it and reflects or diffuses none of it back, except as heat.

Having given in outline the principal phenomena observed in connection with light, and having also traced the main outlines of the development of the various attempts to explain its phenomena we desire in conclusion to point out that at present the line of advance in physical optics seems to be towards some satisfactory explanation of the manner in which luminous matter transfers energy to the ether so as to produce vibratory motion.



The most promising explanation seems to be that, associated with each atom (or perhaps constituting each atom) there are electrically charged particles or electrons, whose mass is mostly, if not wholly, electro-magnetic mass, and whose motions give rise to ether waves. This resolves itself into the necessity of formulating some hypothesis concerning the basic stuff of which the material world is made, and it is strange that the conception the physicist or chemist of the present day forms of this basic stuff is fundamentally the same as that of the earlier philsophers. These ultimate corpuscles, which are generally called electrons, are looked upon as minute structures or condensations of ether. We do not know their real nature, as we do not know the nature of ether. Some conceive of them as vortices ("whirlpools") in a continuous fluid; some think ether a finely granulated substance which is more condensed at these points which we know as electrons.

But when we reflect that these corpuscles are able to travel at 100,000 miles a second, and are so minute that more than a thousand of them have space to execute their prodigious movements within the limits of an atom of hydrogen (which in turn is so minute that billions of them might circulate, at relatively vast distances, within the confines of the letter "o"), we shall hardly expect very precise descriptions of them.

The question is both deep and wide. The future may see great changes in our present notions concerning this phenomena, but that is a problem for the future. Those who are impatient of the actual uncertainties of scientific men should reflect at times on what scientific men have decisively learned for us, and compare it with what people thought about nature five hundred, or even one hundred, years ago.

Electric-Driven Sensitive Bench Drill Press

A bench drill press with several novel features has recently been developed by the High Speed Hammer Company, of Rochester. The press is suitable for all work ranging from the smallest to a 3/16 in. hole. The height of the drill is 24 inches over all and the base is 7½ x 18 inches. The standard spindle speeds are 2100 to 6000 r.p.m., but special pulleys can be furnished to give a main spindle speed of

10,000 r.p.m. The drill is so constructed throughout to insure great accuracy in the work. The main spindle is heat treated and ground to size; it is guided through a bronze quill with an annular ball bearing support at each end. End thrust is taken up by an end thrust ball bearing under the feed arm. A depth gauge is also provided on the feed arm arranged so it can be locked in position. The drill is equipped with 1/10 horse-power, vertical Robbins & Myers motor.

The gross earnings of the Southern Canada Power Company for the half-year ended March 31 totalled $232,950, an increase of $45,292; the expenses $128,727, an increase of $32,327; and the net earnings $104,222, a gain of $12,965.

Personals

Mr. Raymond Beaudry, advocate, has been appointed Secretary of the Montreal Tramways Commission.

Mr. C. F. Sise, general manager of the Bell Telephone Company, has been elected president of the Canadian Club, Montreal.

Mr. Charles Johnson, of Oakville, Ont., has been elected a member of the Canadian Society of Civil Engineers. Mr. Johnson is engineer of the Toronto and York Radial Railway.

Mr. George L. Guy, in private practice as an electrical engineer, at Winnipeg, has been elected a member of the Canadian Society of Civil Engineers. He is also engineer of the Public Utilities Commission of Manitoba, being formerly electrical engineer for the city of Winnipeg.

Mr. A. W. Eshelby, formerly with the British Columbia Electric Railway Company, has entered the railway department of the Westinghouse Electric and Manufacturing Company at Seattle, and will have charge of railway motor equipment and control work in the Seattle territory for the company.
